Dear Bill,
I know you heard my story at the meeting but I know I didn't tell you that cancer does not run in our family. The cancer my girls have is a very common cancer in average age of 60 and usually in men. It is not hereditary and is rare in young women and even rarer to be two young girls in the same family with the exact type of cancer, Non-Hodgkin's Follicular Lymphoma. This cancer is not curable but thank god it is slow moving and treatable. I don't think I mentioned that one daughter is 27 with 2 young children 5 and 2, the other is 24 single with a 2 year old. Now that you have some history behind my story you may understand why I am so concerned. I wish they would take away the existing line totally. They have been to my home and measured for magnetite and come up with low levels however, the line is hardly being used at this time. They did tell me that the third option would put my house in a constant 4.04mG. I know I have higher levels than that around my house but not a constant magnetic field.
Please be very careful to do lots of research when you make your recommendation as to how much is dangerous, does it matter if it is constant or not and how far is considered safe by the whole world and not just the USA. You mentioned in the meeting that you would use whatever resources available, the Internet will give you all the resources that we have plus I would imagine you should have even better and harder to get resources.
People were concerned on all levels at that meeting and I understand each concern but human life has got to be the most important. I am very much hoping to see a very big part of your study is done on the health risks and concerns of everyone down to the smallest effect of living next to a power line. EMF may not be the only risk. Please be sure to post a list of chemicals used on the line in the last 30 years and what they intend to use in the future.
I do have documentation of the power companies measurement etc so let me know if you need them.
I have to also say that our neighbors that were not able to attend will have a higher constant EMF because they live closer to the line.
You also mentioned to give ideas of what else can be done, my husband said this power company paid to have wind generators put up to create the electricity needed for one of the other mines in the area, that may be an alterative. The only other thing would be to go around houses all together.
It isn't like we are going through a metropolitan area that you can't get away from houses.
Please contact me if you have any questions etc. I would also like to see your finding and share them with the girls doctor who will be doing research of his own. I want to share the chemicals used with the doctor as well so we can try to

figure out what is damaging these children before we damage my grand children. Thank you for your time and please, please, please, look out for us and our future by doing a in dept impact statement.

Terri Mjolsness

PS I may write you again if I think of more.
