Management Summary

In January 2009, Stark Preservation Planning LLC (Stark) conducted a cultural resources assessment for the proposed Hiawatha Project (Project), which entails the construction of a transmission line and two new substations in south Minneapolis, Hennepin County, Minnesota by Xcel Energy (Xcel). Currently, five routes, including both overhead and underground alternatives, are being considered. Xcel will be completing and submitting an application for siting and route permits to the Minnesota Public Utilities Commission (PUC). An environmental review document will be prepared for the PUC to determine the Project's impact on the environment, including archaeological and historic resources, and any alternatives that would increase or decrease these impacts. Xcel has contracted Natural Resource Group, LLC (NRG) to assist with the permitting process, and Stark is providing background information on cultural resources within the project area.

The purpose of the cultural resources assessment was to identify known cultural resource properties and the potential for previously unidentified cultural resource properties that may be significant and potentially eligible for the National Register of Historic Places (NRHP) to inform the alternative selection process. No field survey or evaluation of NRHP eligibility was undertaken as part of this assessment. William E. Stark, M.A. served as Project Manager and Principal Investigator for architectural history resources. Andrea Vermeer, Ph.D., RPA of Summit Envirosolutions Inc. served as Principal Investigator for archaeological resources.

Xcel Energy has identified a proposed route and four route alternatives to connect the two proposed substations. One alternative substation site for each of the two substations has also been identified. The project has the potential for both direct effects and indirect (visual) effects. To account for the widest area of potential effect, the study area for the proposed project entails a buffer around the collective corridor alternatives that would extend north to E. 25th Street, east to Minnehaha Avenue, south to E. 32nd Street, and west to 5th Avenue S., in Minneapolis, Hennepin County, Minnesota (T29, R24, Sections 1, 2, 3, 34, 35 and 36; USGS topographic maps Minneapolis South and St. Paul West, Minnesota).

The investigation consisted of a review of the Minnesota State Historic Preservation Office (SHPO) inventory database to identify previously conducted surveys, and previously identified sites and inventoried properties within the study area. The inventory of properties at the Minneapolis Heritage Preservation Commission was also reviewed to identify additional properties recorded for local surveys. Other research included the investigation of secondary sources; a review of a variety of historical maps, including original General Land Office survey maps, Sanborn Fire Insurance Maps, Rascher Insurance Maps; and an examination of historical aerial photographs.

The investigation revealed that several architectural history surveys have occurred within the study area, resulting in a large number of surveyed and evaluated properties. Four properties are individually listed in the NRHP, and seven have been determined eligible for listing. Of particular note is the NRHP-listed Chicago, Milwaukee & St. Paul Railroad Grade Separation historic district that runs the length of

the study area along the Midtown Greenway. Twenty-four properties were noted on the City's "800 List" as potentially significant properties. Although not fully evaluated for NRHP eligibility, 1,650 properties in the study area were noted as having "possible significance" in a 2000 citywide survey.

No known archaeological sites are located within the study area. The study area is considered to have low potential for containing intact precontact archaeological resources. Locations within the study area with the greatest potential for historical archaeological sites are those undisturbed areas associated with 1) historically present residential occupations, where resources may be found within, to the sides, and to the rear of historical building footprints, 2) historically present industrial occupations, where resources may be found within the footprint of the industrial operation, or 3) historically present infrastructural occupations, for which the probable location of resources is dependent on the specific nature of the occupation.

1.0 Introduction

In January 2009, Stark Preservation Planning LLC (Stark) conducted a cultural resources assessment for the proposed Hiawatha Project (Project), which entails the construction of a transmission line and two new substations in south Minneapolis, Hennepin County, Minnesota by Xcel Energy (Xcel). Currently, five routes, including both overhead and underground alternatives, are being considered. Xcel will be completing and submitting an application for siting and route permits to the Minnesota Public Utilities Commission (PUC). An environmental review document will be prepared for the PUC to determine the Project's impact on the environment, including archaeological and historic resources, and any alternatives that would increase or decrease these impacts. Xcel has contracted Natural Resource Group, LLC (NRG) to assist with the permitting process, and Stark is providing background information on cultural resources within the project area.

The purpose of the cultural resources assessment was to identify known cultural resource properties and the potential for previously unidentified cultural resource properties that may be significant and potentially eligible for the National Register of Historic Places (NRHP) to inform the route alternative selection process. No field survey or evaluation of NRHP eligibility was undertaken as part of this assessment. William E. Stark, M.A. served as Project Manager and Principal Investigator for architectural history resources. Andrea Vermeer, Ph.D., RPA of Summit Envirosolutions Inc. served as Principal Investigator for archaeological resources.

1.1 PROJECT DESCRIPTION

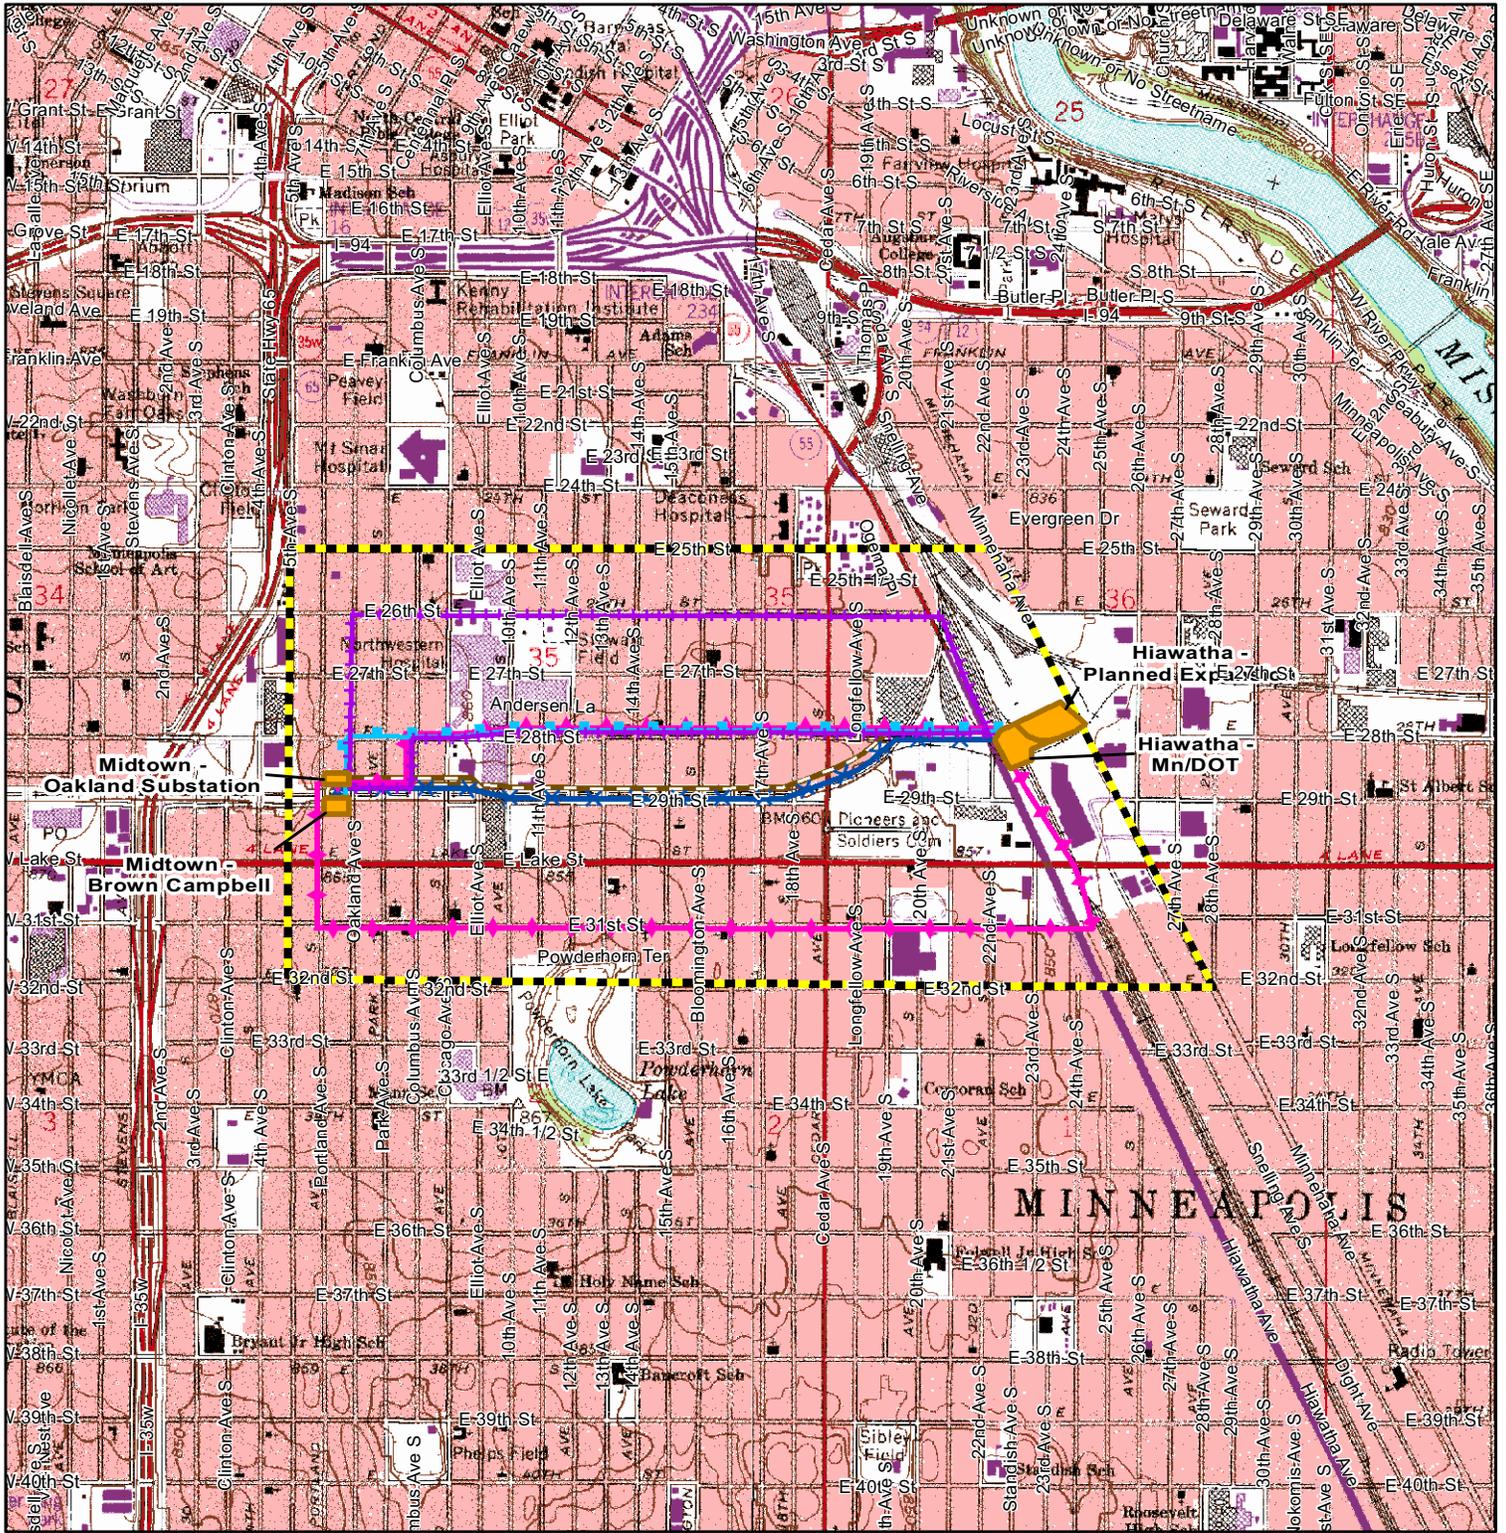

The proposed Project will include the construction of two substations connected by either one double-circuit or two single-circuit 115kV transmission lines, approximately 1.5 miles in length. The proposed substations will consist of the Hiawatha substation, located at approximately Hiawatha Avenue and E. 28th Street, and the Midtown substation, located in the vicinity of E. 29th Street between Portland and Oakland avenues. The final locations of the transmission corridor(s) have yet to be determined. Likewise, it has not been determined whether the proposed transmission line will be overhead, underground, or a combination of both. Figure 1 illustrates the proposed route and route alternatives.

Proposed Route:

- A double circuit overhead line on E. 29th Street tying into the Hiawatha and Midtown Substations.

Route Alternatives:

- Single circuit overhead lines on both E. 26th and 28th streets tying into the Hiawatha and Midtown Substations;
- Single circuit overhead lines on both E. 28th and E. 31st streets tying into the Hiawatha and Midtown Substations;
- A double circuit underground line on E. 28th Street tying into the Hiawatha and Midtown Substations; and
- A double circuit underground line on E. 29th Street tying into the Hiawatha and Midtown Substations.

Map adapted from USGS 7.5 minute topographic maps: Minneapolis South and St. Paul West, Minnesota; T 29, R 24, Sections 1, 2, 3, 34, 35, and 36.

Structure and line placement should be considered preliminary and are subject to change based upon final design. To the extent practicable the aboveground and/or underground lines would be placed within existing rights-of-way; however, that may depend upon limitations in the project area.

1.1.1 Above Ground Transmission Lines

All, portions or none of the proposed transmission lines may be placed above ground. Typically, overhead transmission lines are placed at an average of 400-foot intervals, although closer placement may be necessary in certain areas due to physical limitations. Tower heights would likely be 75 to 100 feet, depending on the type of structure, which has yet to be decided for this project. Material would likely be steel. Figure 2 illustrates examples of these types of transmission line towers. Actual structures have not yet been determined for the project.

Overhead lines require either concrete foundations (drilled piers) or pilings driven into the earth depending on soil type and degree of slope. The depth of the piers depends on soil type and structure height; the foundations are 18 to 25 feet in depth; piers are 7 to 9 feet in diameter. If pilings are used, 3 to 4 pilings that are 6 to 8 inches in diameter are driven approximately 35 feet into the ground.

Figure 2. Examples of Typical Double-Circuit Line (left) and Single-Circuit Line (right)

1.1.2 Underground Transmission Lines

All, portions or none of the proposed transmission lines may be placed below ground. Underground transmission lines may be done either horizontally or vertically. Vertical has one circuit on top of the other, with a total depth of about 12 feet and a width of about 5 feet. Horizontal construction would require approximately a 6-foot depth and 11-foot width for the proposed route. These estimates may vary depending on soil conditions and unanticipated issues during construction.

1.1.3 Substations

The proposed transmission line would terminate at two proposed new substations: the Hiawatha Substation to be located on the east end of the transmission line, and the Midtown Substation to be located at the west end of the transmission line (see Figure 1). An alternative substation site has been identified for each of the two proposed substations.

The Midtown Substation would likely be 176 by 248 feet. The Hiawatha Substation would initially be 253 by 392 feet. The depth of underground infrastructure is yet-to-be determined. There would be underground duct banks, pilings or concrete foundations/footings for the steel structures while the "short and fat" structures would be on poured concrete on top of a sand-gravel-compacted class five bed of about three feet in depth. There would also be a grid of copper conductor buried to ensure conductivity stability; this depth is not yet determined. These dimensions and depths do not include visual barrier walls, green space, etc.

For the Midtown Substation, Xcel Energy proposes a high profile substation, which typically has an average height of 45 feet, but requires a smaller footprint. Xcel Energy is proposing a low profile style for the Hiawatha Substation; the height would be around 20 feet.

1.2 PROJECT STUDY AREA

Xcel Energy has identified a proposed route and four route alternatives to connect the two proposed substations. One alternative substation site for each of the two substations has also been identified. The purpose of the cultural resources assessment was to inform the project's design and planning process by identifying known cultural resources in the study area and the potential for unidentified cultural resource properties that may be significant and eligible for the NRHP and potentially be affected by the project. The project has the potential for both direct effects and indirect (visual) effects. Although direct, physical effects to buildings may not occur, effects to landscapes may be a consideration. There is potential for direct effects to below-ground archaeological resources for both the underground alternatives and the above ground alternatives, which would have below ground effects where the poles are placed and for substations.

The erection of transmission towers to carry the lines may also have visual effects to cultural resources in the vicinity with the potential to alter or impair important character-defining features. Built-up urban areas tend to limit views of tall structures, such as utility poles, so the structures would be unlikely to have adverse effects to the historic character of an urban property from longer distances. For these reasons, the study area for the proposed project entails a buffer around the collective corridor

alternatives that would extend north to E. 25th Street, east to Minnehaha Avenue, south to E. 32nd Street, and west to 5th Avenue S. (T29, R24, Sections 1, 2, 3, 34, 35 and 36; USGS topographic maps Minneapolis South and St. Paul West, Minnesota) (see Figure 1).

2.0 Methods

2.1 OBJECTIVES

The purpose of the cultural resources assessment was to inform the Project’s design and planning process by identifying known cultural resources in the study area and the potential for unidentified cultural resource properties that may be significant and eligible for the NRHP and potentially be affected by the Project. The cultural resources assessment entailed both architectural history and archaeological components.

The principal objectives of the architectural history assessment were 1) to analyze existing information to determine the presence of previously identified architectural history properties within the study area and their potential significance; 2) through a comparison of this existing information and experience and knowledge of the study area, to determine the potential existence of any previously unidentified, potentially significant properties or areas; and 3) to discuss properties and/or portions of the study area that may have a lower or higher risk of encountering potentially significant architectural history properties in order to assist Xcel in their future planning efforts.

The principal objectives of the archaeology assessment were 1) to identify all previously recorded archaeological resources within the study area, particularly those that are listed in or are eligible for the NRHP, 2) to assess the potential for intact precontact archaeological sites to exist within the study area, and 3) to outline, based on a literature search, the conditions under which potentially NRHP-eligible historical archaeological resources are more likely or less likely to be present within the study area.

2.2 ARCHAEOLOGICAL AND HISTORIC RESOURCES DEFINED

PUC rules indicate that “archaeological and historic resources” are among the factors to be considered for the permitting of large high voltage transmission lines. The rules do not define the qualities of archaeological and historic resources that would be sufficient factors to consider. In most cases, standards used for the NRHP can be used to define significant resources types. The NRHP is a federal program of the National Park Service (NPS), and is locally administered by the Minnesota SHPO. The NPS has established criteria for evaluating the significance of historic resources in four broad areas:

- A. Properties that are associated with events that have made a significant contribution to the broad patterns of history;
- B. Properties that are associated with the lives of persons significant in the past;
- C. Properties that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; and
- D. Properties that have yielded, or may be likely to yield, information important in prehistory or history.

While all four criteria are considered, archaeological sites are typically eligible for listing in the NRHP under Criterion A or D.

In addition, criteria considerations may apply to certain properties that are generally not eligible for the NRHP and require an additional step of evaluation to determine if they meet NRHP eligibility. These properties include cemeteries, birthplaces or graves of historical figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, properties primarily commemorative in nature, and properties that have achieved significance within the past 50 years.

The NPS has identified seven aspects of integrity to be considered when evaluating the ability of a property to convey its significance: location, design, setting, materials, workmanship, feeling, and association (National Park Service 1995). This assessment, therefore, takes into account conditions related to both significance and integrity with regard to the potential eligibility of any cultural resources that might be present.

In the case of the Hiawatha study area, the City of Minneapolis also has local historic landmark designation procedures through its Heritage Preservation Commission (HPC). It would be appropriate, also, to consider properties designated at the local level as important historic resources worthy of consideration in the PUC permitting process. The following criteria, similar to those used for the NRHP, are considered in determining whether a property is worthy of designation:

1. The property is associated with significant events or with periods that exemplify broad patterns of cultural, political, economic or social history;
2. The property is associated with the lives of significant persons or groups;
3. The property contains or is associated with distinctive elements of city identity;
4. The property embodies the distinctive characteristics of an architectural or engineering type or style, or method of construction;
5. The property exemplifies a landscape design or development pattern distinguished by innovation, rarity, uniqueness or quality of design or detail;
6. The property exemplifies works of master buildings, engineers, designers, artists, craftsmen or architects; and
7. The property has yielded, or may be likely to yield, information important in prehistory or history.

The city may designate both individual properties and districts.

In addition to properties that are officially designated as historic resources, either by the NPS or by the City, both the Minnesota SHPO and the Minneapolis HPC maintain a significant inventory of properties that have been identified through various means. In many cases, these represent a listing of properties considered, at least at the time of the inventory, to possess potential for either NRHP or HPC designation. In other cases, they may have been inventoried as part of a comprehensive survey and noted as *not* being eligible for designation. While other secondary research and anecdotal sources reviewed as part of this project contributed to an understanding of the historic potential in the study

area, the SHPO and HPC inventory files are by far the most useful and comprehensive source of historic documentation.

2.3 BACKGROUND RESEARCH

2.3.1 State Historic Preservation Office

On December 30, 2008, the Principal Investigators conducted background research through the Minnesota SHPO database to identify all inventoried properties, sites and previous investigations conducted within the study area.

2.3.2 Heritage Preservation Commission

In January 2009, Stark conducted a review of files at the Minneapolis HPC to identify those properties that are locally designated or have potential to have historic significance. These files also indicated many properties that have applied for wrecking permits.

2.3.3 Historical Visual Media

The original General Land Office (GLO) survey maps of the study area were consulted to understand its environment, landscape, and use prior to the substantial commercial, industrial, and residential development that occurred there beginning in the late 1800s. Subsequent changes to these elements were assessed through a review of historical fire insurance maps (Sanborn Map Company 1885, 1912, 1924, and 1951; Rascher Insurance Map Publishing Company 1906) and detailed city atlases (Hopkins 1885; C. M. Foote Publishing Co. 1898), often in comparison with current aerial photographs.

Reconstructing the environmental, landscape, and use history of the study area provides two types of information. The first type is that relating to the potential for archaeological resources to be present in a given location, which is explained in Section 2.4. The second type is that relating to the potential for archaeological resources to remain intact. Changes to the landscape during a given period can severely disturb the archaeological record of an earlier period; thus, for example, if a large industrial building with a basement was constructed during the early 1900s, any precontact-period resources that had been present in the location of the building were likely excavated in the process of creating the basement, which would compromise the integrity of the precontact archaeological site. Archaeological sites that have been heavily disturbed typically do not retain the integrity necessary to be eligible for listing in the NRHP.

2.3.4 Contextual History

The Hennepin County Public Library's Minneapolis Collection was consulted to identify resources that contribute to the understanding of the overall development within the study area and potential historic resources. Although files for each of the neighborhoods that included clippings and planning documents were reviewed, only minimal information was available to provide either a broad contextual understanding of the study area or information on the potential significance of individual properties. Secondary sources, such as *South Minneapolis: An Historic Context* (Pearson and Roise 2000), *Where We Live: the Residential Districts of Minneapolis and Saint Paul* (Martin and Lanegran 1983), *Legacy of Minneapolis: Preservation Amid Change* (Borchert et al. 1983) provided some general context that was

useful in developing the background statement. A brief publication called *Phillips Neighborhood Historic Study* (The Phillips Partnership n.d.) offers some basic history of the neighborhood's development, historic photographs, as well as limited information on local developers, plan books and residential landscaping.

Historic contexts previously developed for portions of the study area, specifically those developed by Stark et al. (2002a), Stark and Vermeer (2004), and Vermeer and Stark (2004), provide one basis for assessing whether potential archaeological resources within the study area are likely to meet NRHP criteria of significance. Because, however, these contexts do not address the entirety of the study area, more generalized research themes that could be derived from the contexts, such as class and ethnicity, are also considered here.

2.3.5 Map Research

Sanborn Fire Insurance Maps from 1885, 1912, 1924 and 1951 and the Rascher Insurance Map from 1906 were consulted to form an understanding of the general development of the study area as an urban location and to identify potential for the locations of important properties.

2.3.6 Field Investigations

No field investigations were conducted as part of this cultural resource assessment. Documentation of extant or non-extant resources was not confirmed except when noted in files.

2.4 ASSESSMENT OF ARCHAEOLOGICAL POTENTIAL

The assessment of an area's potential to contain archaeological resources is based on the analysis of the terrain, water sources, and other natural resources, as well as the built environment in and adjacent to that area. Permanently wet areas (e.g., wetlands and streams), poorly drained areas, and areas with slopes greater than 20 percent are generally considered inhospitable to human occupation, so these are considered to have low potential for containing archaeological sites.

2.4.1 Precontact Archaeology

In general, drier, upland landforms (e.g., terraces) in proximity to a natural water source or wetlands are considered to have moderate to high precontact archaeological potential. "Proximity" is typically within 500 feet, but the distance varies according to environmental conditions such as the size of the body of water, the nature of the water source (perennial versus intermittent), and the extent of the floodplain, all of which can impact the archaeological potential of a given location.

Topographic prominence is often indicative of high precontact archaeological potential. Burial mounds, for example, are frequently located on high river bluffs. Higher, and therefore drier locations were conducive to settlement. Additionally, topographically prominent locations were likely desirable locations for settlements or camps as they provided vantage points for observation, which would be useful for tracking the movements of game or recognizing potential threats to the occupation.

The presence of an extractive resource can also raise the potential for precontact archaeological sites in a given location. Large outcrops of preferred lithic materials, for example, are often the location of

quarry sites; in another example, the possibility exists for clay-extraction sites near large, high-quality clay deposits.

Proximity to previously recorded precontact sites points to high precontact archaeological potential because the previously recorded sites tend to be in areas where the natural and environmental conditions discussed above are present. In addition, the extent of archaeological sites often cannot be fully defined during a single project, so unrecorded resources often exist just outside of the known boundaries of previously identified sites.

2.4.2 Historical Archaeology

The assessment of an area's potential to contain historical archaeological resources is based largely on an examination of historical documents and maps, as well as secondary sources, for information indicating the occupation of an area by residences, businesses, towns, camps, farmsteads, industrial properties, and the like. Areas in proximity to such occupations generally hold higher potential for containing historical archaeological resources, but proximity alone is not sufficient to determine the potential of a location to contain such resources. The behavioral patterns of the past occupants, including the activities they carried out and the ways in which they were likely to use their spaces, will strongly affect the likelihood of uncovering archaeological resources in a given location.

Consider, for example, a house occupied by a family during the 1860s. The house was built in a given location, and the family carried out much of their daily activity there. Perhaps some of the items they used fell through the floorboards and could not be recovered, but by and large, any items that they used and then disposed of would be removed from the location of the house. Because regular trash collection was not established at that time, the family decided to dig a pit in which to dispose of trash on their property. Because it was not socially acceptable to dispose of refuse in the front yard, the family put the midden to the rear of and at a sufficient distance from the house to prevent odors or other types of contamination of their primary living space. In this scenario, the front yard of the house, although close to the primary occupation, would be unlikely to contain historical archaeological resources. The location of the house itself might contain its foundations and the few scattered items that were irretrievable or overlooked. The location of the trash midden in the backyard would contain a dense artifact deposit, which would contain the most substantial information on reconstructing the family's lifeways. It is not surprising, therefore, that the side and rear yards of buildings often have the highest potential for containing historical-archaeological resources; in fact, one of the most important sources of historical archaeological materials is privy pits, which were frequently filled in, either over time or during single cleanup episodes, with discarded material culture that speaks directly to the lifeways of a site's former occupants.

For those areas and early historical periods for which documentation is not available, the same conditions governing precontact archaeological potential can apply, as natural and environmental conditions conducive to precontact occupation and use were similarly conducive to later occupation and use.

3.0 Previous Investigations

3.1 ARCHITECTURAL HISTORY RESOURCES

3.1.1 Minneapolis Survey: Powderhorn Park, Central, Whittier, and Phillips Neighborhoods

In 2001, URS/BRW completed a historic resources survey for the City of Minneapolis of the Powderhorn Park, Central, Whittier and Phillips neighborhoods in south Minneapolis (Mitchell 2001). This survey area covers most of the study area west of Hiawatha Avenue. The objective of the survey was to collect data on properties in the neighborhoods that will contribute to a historic resource inventory of Minneapolis. The survey area encompassed 8,005 properties, of which 5,776 were included in a photo survey. Although only minimal information was gathered on the surveyed properties and no SHPO inventory numbers were assigned, each property was assigned one of three survey categories described as follows:

1) *Properties with no obvious historic significance*

This survey level includes properties that have no obvious historic or architectural significance, such as modern commercial structures built of concrete block. Also included in this level were addresses that were associated with parking or vacant lots.

2) *Properties with possible significance that do not retain integrity*

This survey level includes properties that have possible historic or architectural significance but did not appear to have sufficient integrity for local or national listing.

3) *Properties with possible significance that retain integrity*

This survey level includes properties that have possible historic or architectural significance and appear to retain sufficient integrity for local or national listing.

The largest majority of properties were assigned Category 3, although no specific significance was described for these properties. Further investigation would be required to determine if the property might meet local or NRHP listing criteria.

Within the Powderhorn Park neighborhood, a slightly more complete survey was conducted, and recommendations were provided for further investigation; URS/BRW did not provide similar recommendations for other neighborhoods in their survey. Several of the recommendations in Powderhorn Park are for properties also within the Hiawatha Project study area including:

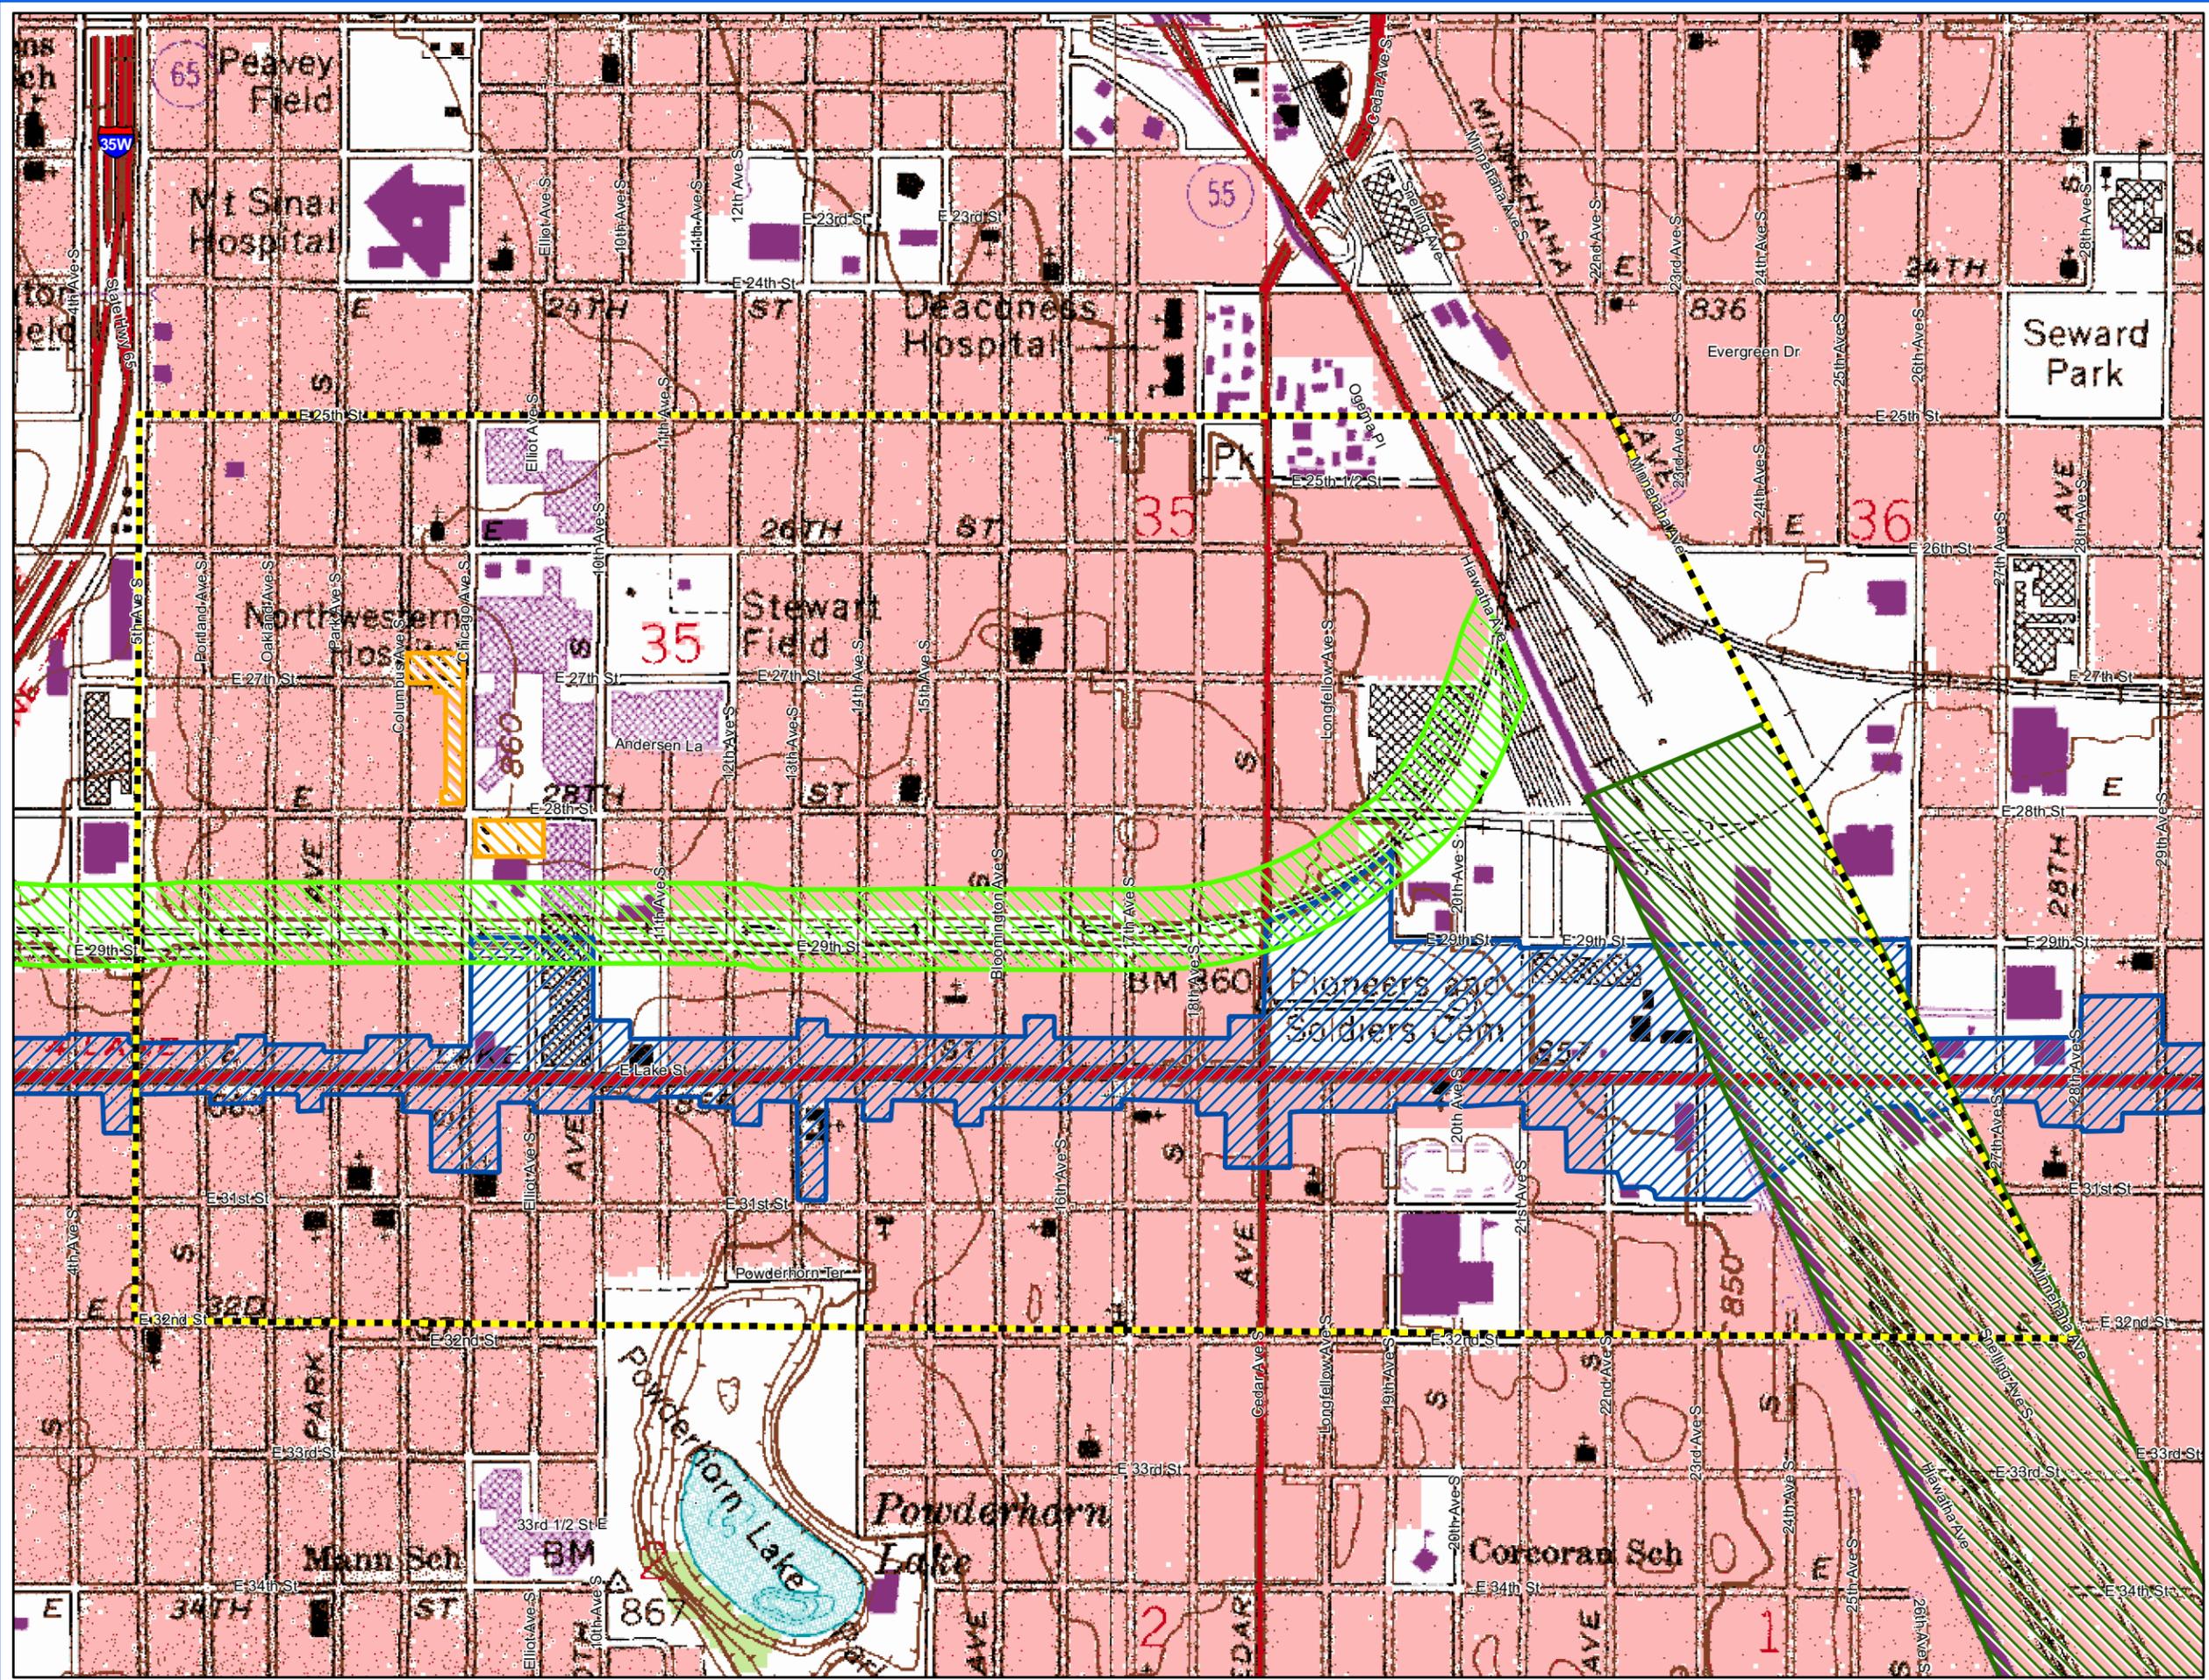

- 3000 block of 17th Avenue S. – an early group of brick workers housing;
- Powderhorn Lake and Park and the 3100 block of 11th Avenue S. and 3100 through 3500 blocks of 10th Avenue S. – large, single-family dwellings that could be related to the park and may have been home to significant persons in the development of the area;
- Apartment flats on Powderhorn Terrace, 12th Avenue S. north of Powderhorn Park, 14th Avenue S. east of the park, and others throughout the neighborhood;
- 1700 block of E. 31st Street – a series of four paraged stone houses that are unique to the neighborhood; and
- East Lake Street commercial corridor.

3.1.2 Midtown Greenway Survey

In preparation for the removal of railroad service and the construction the Midtown Greenway bicycle/pedestrian trail, The 106 Group conducted an investigation in 2001 of the Stewart-Cepro grain elevator (2836 11th Avenue S.; HE-MPC-0625), which would be acquired by Hennepin County (Stark and Zschomler 2001). The investigation resulted in a finding of eligibility as an illustration of the importance of the grain trade in the first half of the twentieth century. It was subsequently recorded in the Minnesota Historic Property Record and demolished.

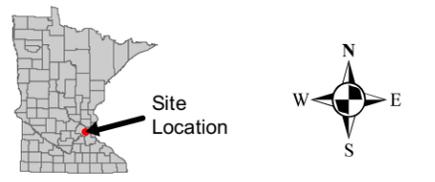

A broader architectural history investigation was conducted by The 106 Group in 2001 and 2002, for the entire Midtown Greenway project area, a route that followed the railroad corridor roughly parallel to 29th Street (Stark et al. 2002a). The study area was defined as the area that included the first property to the north and south of the Midtown Greenway right-of-way and any other property that was physically tied to the rail line historically and was dependent on the line for business (Figure 3). The survey corridor was approximately 4.5 miles long, and extended from France Avenue on the west to Hiawatha Avenue on the east. The corridor passes through the Hiawatha Project study area. The investigation identified 112 properties over 50 years of age within the APE; 8 properties were previously listed or determined eligible for listing in the NRHP. Following the completion of the Phase II investigation, two individual properties were determined eligible for the NRHP, both of which are within the Hiawatha Project study area. The Southside Destructor at 2840 20th Avenue S. (HE-MPC-3504) was recommended as eligible under Criterion A as an example of a larger trend of urban waste management and also under the Federal Relief Construction context. The Zinsmaster Baking Company at 2900 Park Avenue S. (HE-MPC-4220) was recommended as eligible under Criterion A as an example of a larger, wholesale bakery from the period of the rise of industrial bakeries and for its association with the City of Minneapolis' community planning and development and government/politics and under Criterion B for its association with Harry Zinsmaster.

Most significantly, the investigation determined that the Chicago, Milwaukee & St. Paul Railroad grade separation corridor itself was eligible for the NRHP under Criterion A in the area of community planning and development as a representation of the culmination of efforts by the citizens, city government and city planners of Minneapolis to direct the future growth and appearance of south Minneapolis while ensuring the safety of its residents and maintaining economically necessary industrial interests. The corridor, along with eight adjacent buildings and 28 historic street bridges crossing the corridor has subsequently been listed in the NRHP as a historic district.

3.1.3 Lake Street Repaving and Streetscape Survey

The *Phase I and II Architectural History Investigations for the Lake Street Repaving and Streetscape Design Project, Minneapolis, Hennepin County, Minnesota* (Stark and Vermeer 2004) was completed between 2002 and 2004. This study was undertaken for Hennepin County in preparation for a repaving and streetscape design of Lake Street, and was reviewed by the Minnesota Department of Transportation and the Minnesota SHPO. The survey generally extended from Dupont Avenue to the Mississippi River, an area that includes the Hiawatha Project study area. The survey documented all properties facing Lake Street constructed before 1955 (see Figure 3). Property evaluation was limited to the context of the Lake Street commercial corridor; evaluation within other contexts may result in NRHP eligibility where properties were determined not eligible in that study.

The survey documented 199 properties within the APE. Six properties were listed in or previously determined eligible for the NRHP and one property was previously recommended eligible. An additional 10 properties were recommended as eligible for the NRHP following the Phase II investigation. Within the Hiawatha Project study area, the following properties documented in the Lake Street survey are considered eligible for the NRHP:

- Roberts Shoes/Commercial Building, 730-740 E. Lake Street (HE-MPC-4113)
- Anderson Brothers Funeral Parlor, 119 E. Lake Street (HE-MPC-4117)
- Miner-Anderson Automobile Dealership, 1201 E. Lake Street (HE-MPC-14018)

In addition, the following properties were previously determined eligible or listed in the NRHP:

- Avalon Theater, 1500 E. Lake Street (HE-MPC-4116);
- Minneapolis Pioneers and Soldiers Memorial Cemetery, 2925 Cedar Avenue S. (HE-MPC-4123);
- Sears Building, 900-930 E. Lake Street (HE-MPC-3517).

The remaining properties were found to be not eligible.

In 2004, The 106 Group was asked to complete additional survey work related to the Lake Street project within an expanded APE in two locations. These locations are within the Hiawatha Project study area, and include areas extending approximately one-half block south of Lake Street on Cedar Avenue and Chicago Avenue. The addendum report identified eight architectural history properties within the expanded APE; they were recommended as not eligible for the NRHP due to lack of significance.

3.1.4 Abbott Northwestern Expansion Study

In April 2002, The 106 Group conducted an architectural history investigation and archaeology assessment for the Abbott Northwestern Hospital (Hospital) Campus Expansion project to contribute to an Environmental Assessment Worksheet (Stark et al. 2002b). The Hospital proposed to construct a childcare center and would be receiving funds through the U.S. Department of Housing and Urban Development (HUD). Fifteen architectural history properties on Chicago Avenue S. between 27th and 28th streets and on 27th Street were documented for the project (see Figure 3). One property, the Goodlund Rowhouse at the corner of Chicago Avenue S. and 27th Street (HE-MPC-13782) was

recommended as eligible for listing in the NRHP, and subsequently considered eligible by the SHPO. The remaining architectural history properties were recommended as not eligible.

3.1.5 Minnehaha-Hiawatha Corridor Study

Landscape Research recently completed a study of the area between Minnehaha and Hiawatha Avenues from 28th street on the north to Minnehaha Parkway on the south, an area that partially overlaps with the Hiawatha Project study area, for Hennepin County (Zellie and Lucas 2008) (see figure 3). The objectives of the study were to provide a land use history for the project area and a historic context framework for the future evaluation of historic resources. A second part, to be completed in 2009, will provide an evaluation of properties potentially eligible for the NRHP.

Although this preliminary study did not provide a formal evaluation of properties eligible for the NRHP, it did suggest that a grouping of residences on the 3100 block of Minnehaha Avenue may possess historic significance as important examples of early twentieth century worker cottages built for employees of the nearby Minneapolis Steel and Machinery Company.

3.2 ARCHAEOLOGICAL RESOURCES

Background research revealed that no archaeological surveys have previously occurred within the project area. Although an archaeology assessment was conducted for the Lake Street Repaving and Streetscape Design project located along Lake Street within the current study area (see Figure 3), it was limited to the depth to which construction would occur, and therefore considered only that area previously disturbed by the original construction of Lake Street, its curbs, and its sidewalks (Stark and Vermeer 2004).

4.0 Results

4.1 HISTORICAL OVERVIEW¹

The study area that is now so firmly a part of the Minneapolis urban landscape was once part of the broad prairie that extended southward from the Mississippi River and the St. Anthony Falls. Euro-American settlement was initially undertaken by farmers who cultivated the land not far from the heart of Minneapolis, which was established in 1856, just several years after the Minnesota formally became a territory. Growth came to Minneapolis by virtue of its natural resources, including lumber and agriculture, and with the roaring St. Anthony falls, which helped to transform the raw materials into manufactured goods. By the 1880s, Minneapolis experienced a population boom, and the study area was transformed as a result.

Established in 1860, Layman's Cemetery (renamed the Pioneers and Soldiers Memorial Cemetery in 1926) is one of the city's oldest; it is located within the study area and listed in the NRHP. The early reservation for these purposes has resulted in it being one of the few areas not fully developed in the urban landscape.

The Minneapolis Harvester Works were built in 1873 at Lake and Hiawatha to manufacture farm machinery. This would later become Minneapolis Steel and Machinery Company, and then Minneapolis-Moline. The railroad established maintenance shops at Hiawatha and 26th Avenue South in 1870. Although neither facility is extant, the manufacturing and shops industrial area provided considerable opportunities for employment and urged the development of the modest, worker housing that dominates the study area.

Most of the study area was annexed by the city in 1883, with portions north of 29th Street between 21st and 28th Avenues being annexed slightly earlier. By 1887, Minneapolis' territory extended all the way to 54th Street. Sanborn Fire Insurance Maps and platbooks from this era illustrate a sparsely populated area, where remnants of larger parcels and farms coexist with the up and coming development of neatly platted blocks and uniformly sited single-family houses.

Railroads strongly influenced the character of the area and its development. In 1880, the Chicago, Milwaukee & St. Paul Railroad (CM&StP) connected its short line from St. Paul on a bridge across the river at 26th Street East, which ran to Hiawatha Avenue to head north into downtown. Between 1879 and 1881, the same line built its Benton Cutoff of the Hastings & Dakota Division along 29th Street from the west, which also approached Hiawatha Avenue. The confluence of rail connections made Hiawatha an attractive location for industry. As population became increasingly dense in south Minneapolis, the rail corridor line would be pushed below grade in a 2.8-mile stretch between Hennepin and Hiawatha avenues in a massive trenching project. The grade separation is now a district listed in the NRHP.

¹ This brief historical overview was adapted from *South Minneapolis: An Historic Context* (Pearson and Roise 2000) and the historic context for the Lake Street architectural history investigation (Stark and Vermeer 2004).

Passenger street car lines enabled the residents of a growing city to live beyond walking distance of their places of employment. Most lines ran north-south and first reached Lake Street in 1883. In rapid succession during the next decade, many would meet or cross Lake Street, including several in the study area such as Eighth, Cedar, Bloomington, Minnehaha, and Chicago Avenues. East-west lines were constructed along major streets and served as inter-city connectors. The Lake Street line was extended into St. Paul via a new bridge in 1887, where it continued on Selby Avenue in St. Paul. Its presence was a major contributor to the development of Lake Street as a commercial corridor.

Higher-end residential developments occurred in several south Minneapolis areas, including Park Avenue, where grand houses were designed in popular styles by prominent local architects. Two particularly notable Park Avenue residences are within the study area: the Swan Turnblad House (NRHP listed; 2600 Park Avenue S.) and the Charles M. Harrington House (locally designated; 2540 Park Avenue S.). By and far, south Minneapolis (and the study area) was occupied by unpretentious houses built for the middle class, especially along the streetcar lines. Most of these were built in the study area between 1880 and 1920, reflecting the styles of that period, which ranged from Queen Anne to Arts and Crafts bungalows. The Bardwell-Farrent House at 2500 Portland is a remarkable Queen Anne example and listed in the NRHP. The occupants of these middle-class abodes in the Phillips and Whittier neighborhoods tended to be “Old-Stock American,” or people who immigrated to Minnesota from other places in United States, typically the New England states. The area around Powderhorn Park was intended for those working in the nearby industries, and was especially popular with Scandinavian immigrants. While single-family dwellings were the predominant housing type, multi-family dwellings became popular after 1900, with buildings ranging from two to eight units in small apartment buildings. A number of good examples of this building type can be found in the Powderhorn Park area.

Commercial districts at the turn of the last century tended to develop around streetcar lines, particularly at transfer points. Lake Street, with many north-south lines crossing it, provided ample opportunity for commercial development, and several nodes were established and grew. Institutions that served the newly settled residents of the area also sprang up, including churches, schools and healthcare facilities. Several churches dating from the late nineteenth or early twentieth centuries are located in the study area, although no historic schools are extant.

By the 1920s, the study area was fully established. The city as a whole continued its infrastructure improvements with increased street paving, sidewalks, street-lighting, water mains and sewer system. In 1922, 60,000 homes were lit by electricity. The increasing popularity of the automobile also had an impact on the urban scene; the city was home to some 80,000 of them in 1936. The streetcar system reached its peak of 138.6 million passengers in 1920; by 1937 it dropped to 67.6 million passengers. The streetcar system was entirely eliminated by 1954.

The passage of the first zoning ordinance in 1924 codified many of the existing uses, and encouraged the transition of neighborhoods. A wide segment of south Minneapolis – from downtown to approximately 40th Street from 34th Avenue to Hennepin Avenue – was designated as a multiple-dwelling district. Lake Street was considered a light-industrial district, and heavy industrial areas were confined to those found

around the rail yards. These changes would have a transformative effect to the study area, which included moderate to upper end housing, commercial areas and an industrial employment base. The grand houses of Park Avenue transitioned from an enclave for the elite to one with extensive social service and other institutional purposes. Some would eventually build to suit their own purposes, as Lutheran Social Services did in 1957. Swan Turnblad donated his mansion for the Swedish American Institute.

Movie theaters began to spring up in the neighborhoods outside of the downtown district during the 1920s and 1930s, including the Avalon at 1500 E. Lake Street (NRHP eligible). Gas stations replaced and supplanted livery stables with the rise of automobiles. Sears, Roebuck and Company at E. Lake Street and Elliot Avenue built a massive structure that served retail customers and operated a catalogue distribution center via the nearby rail lines (NRHP listed).

The increased use and availability of automobiles and the suburban expansion during the post-World War II years brought major changes to neighborhood commerce. Competition from suburban shopping malls created an urban response in the form of the strip mall. The Hi-Lake Center, at Hiawatha and Lake Street, is one such response from the mid-1950s. The need for parking lots punched holes in the otherwise uniform commercial corridor.

Mid-century changes to this urban area called for a renewal in the latter half of the twentieth century. Within the boundaries of the Powderhorn neighborhood stood a wide array of urban building and social issues, like an aging housing stock, single-family dwellings converted to rooming houses, a mixture of industry and housing, especially along the 29th Street corridor, and dilapidated schools. Furthermore, the construction of Interstate 35-W, begun in 1959, would cut the neighborhood in half. The area became part of the Minneapolis Model Cities demonstration project in the mid-1960s, which set out to make both social and physical improvements. Although there was no wholesale clearance, senior citizen high-rises were constructed, neighborhood parks expanded and new schools built. Improvements were made to the existing housing stock.

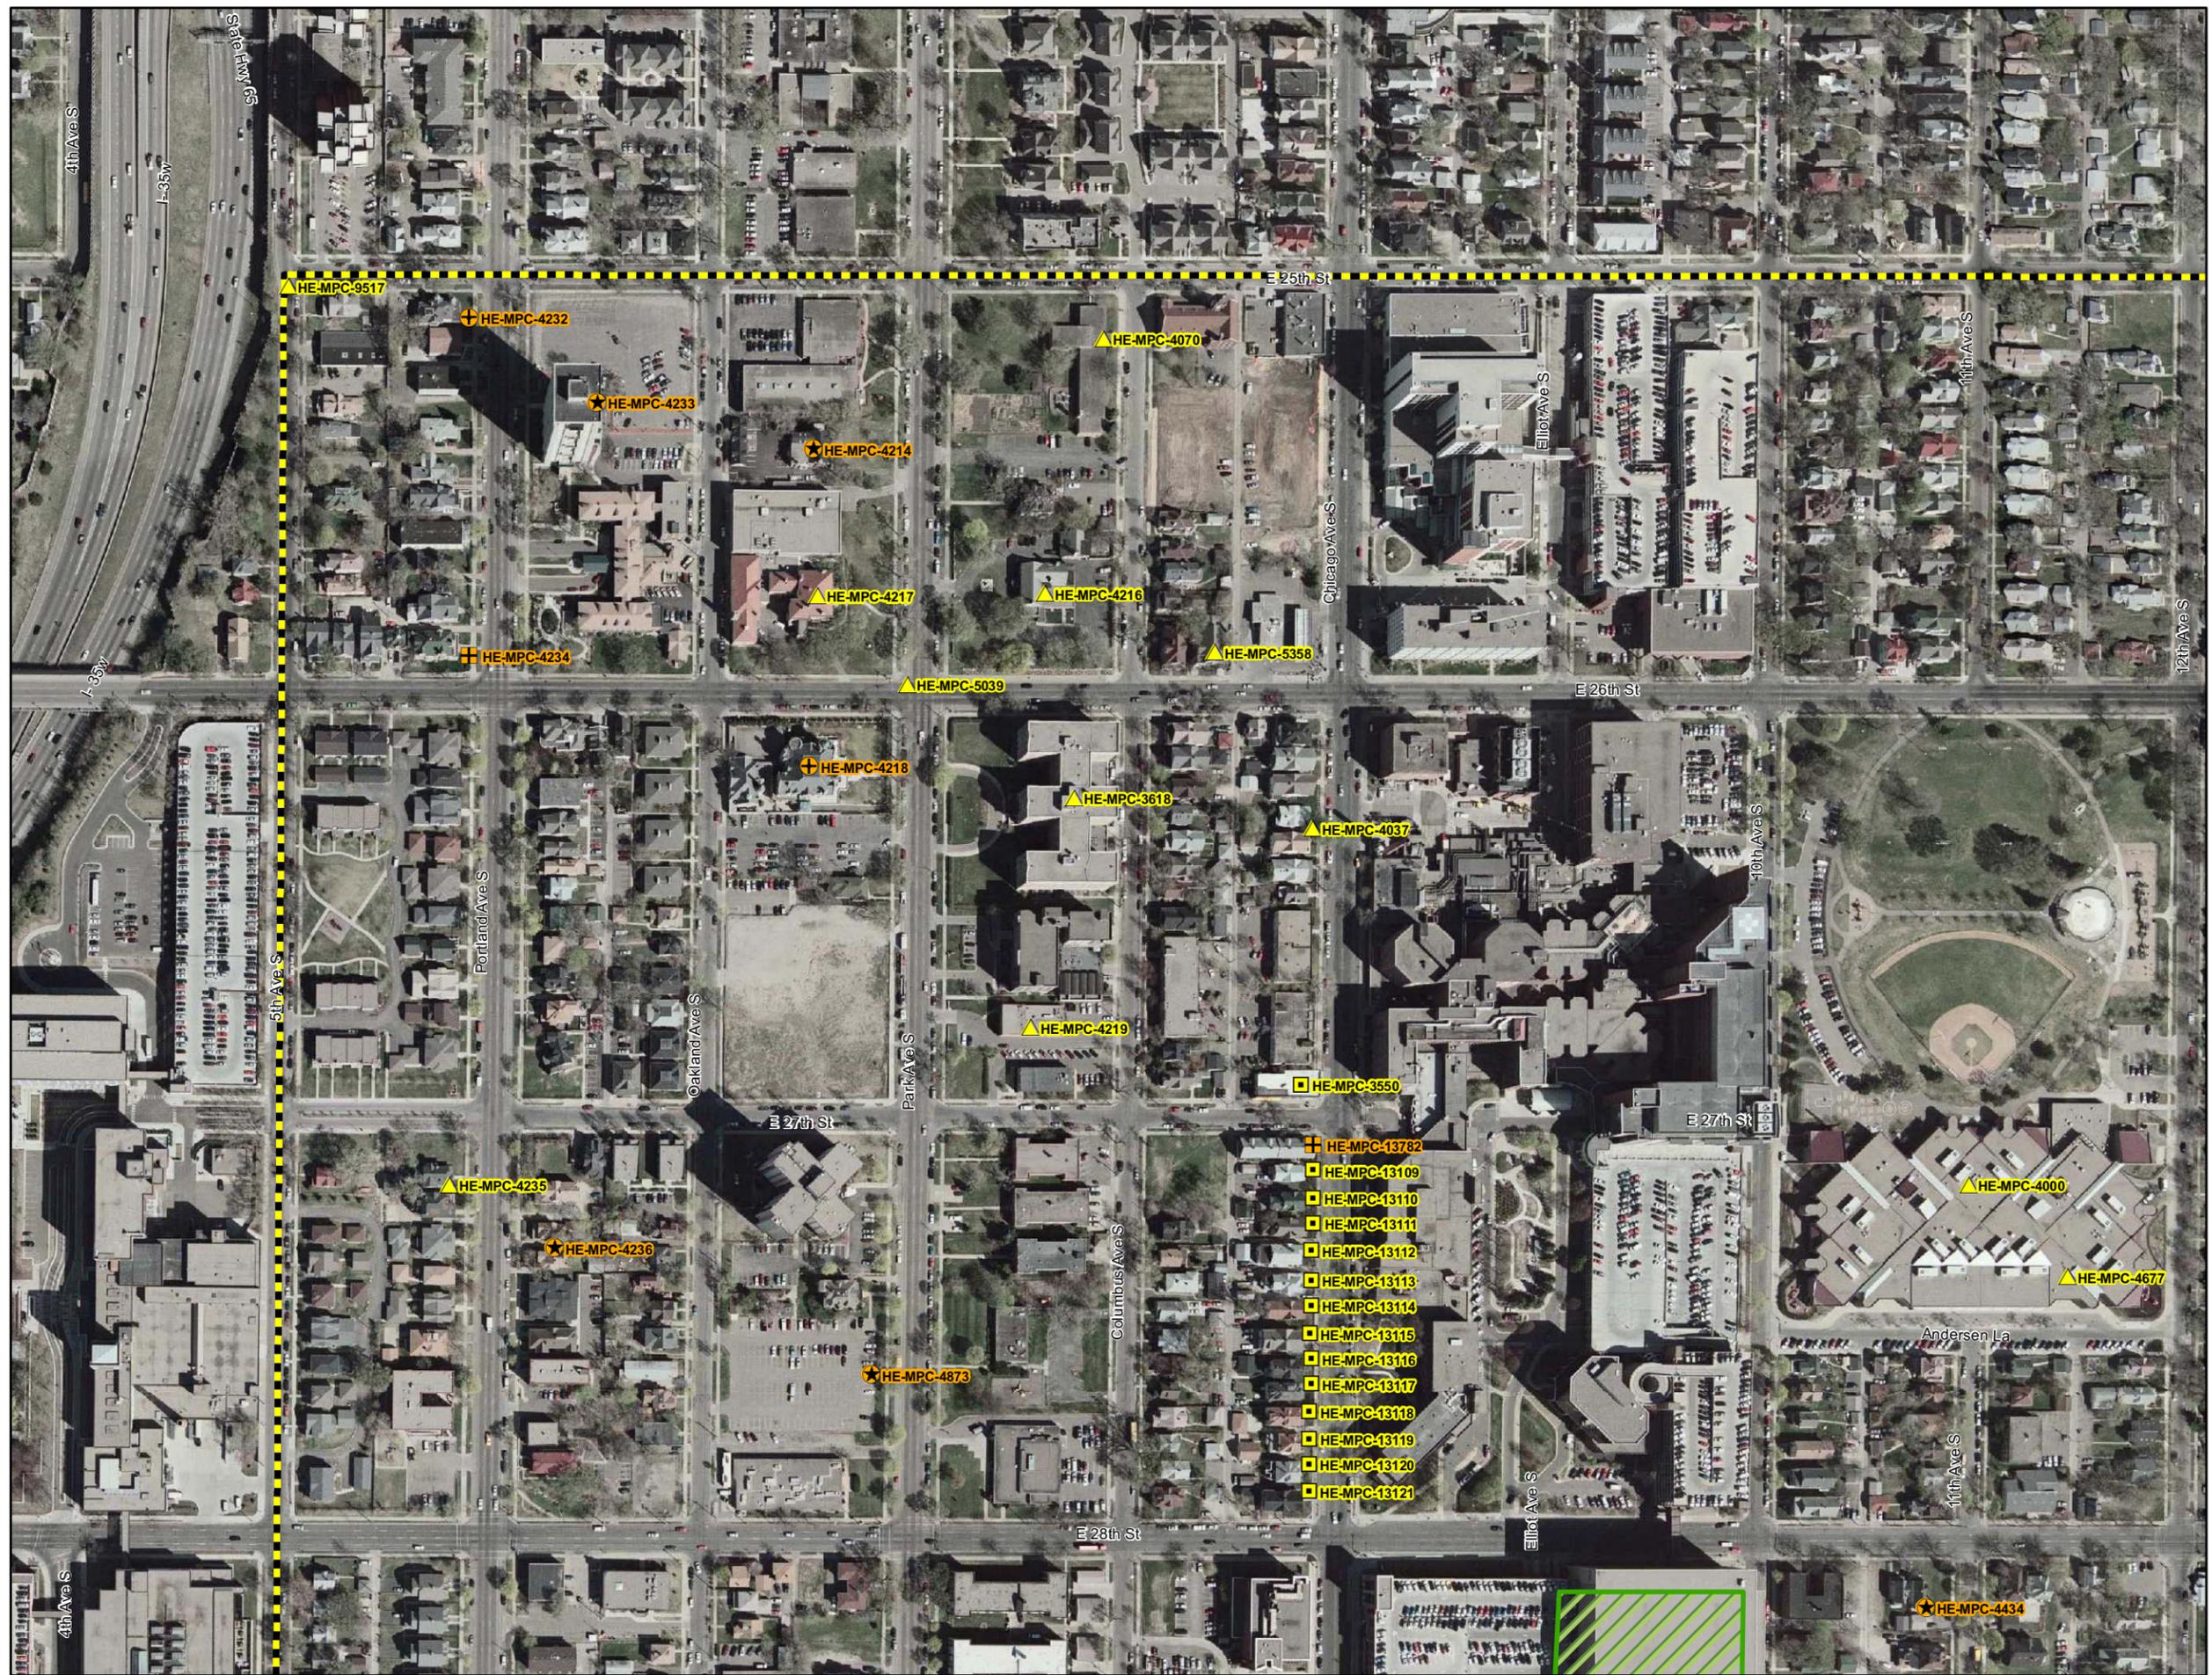

The 1970 closure of the Minneapolis-Moline plant at Minnehaha Avenue and E. 27th Street resulted in neighborhood job losses. The site was converted to a shopping center that housed the city's first Target Store (1976). Honeywell, another local employer, closed down its campus in 1999 when it merged with Allied Signal of New Jersey. Railroads and grain elevators have also had a diminished presence in the area in the past several decades.

Since then, the neighborhoods has seen a revival with the development new housing and the arrival of new employers. Within the last decade, Wells Fargo Home Mortgage acquired and moved a major facility into the old Honeywell campus. Allina Hospital and Clinics have expanded their Abbott Northwestern campus and located their corporate headquarters in the historic Sears Building. Other parts of the Sears Building have been converted into rental and for-sale apartment lofts. A new 136-room hotel, the Sheraton Midtown Minneapolis, is located adjacent to the Midtown Greenway, the Midtown Exchange, and the Allina facility. At the east end of the study area, the Lake Street station of the Hiawatha Light Rail provides easy transit to other parts of the city.

4.2 ARCHITECTURAL HISTORY

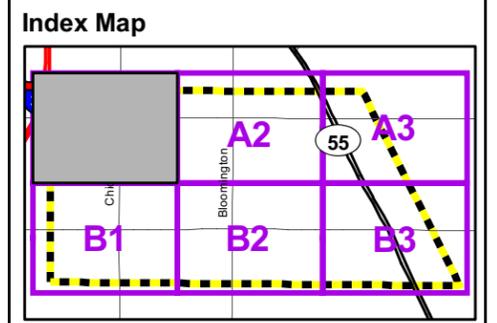

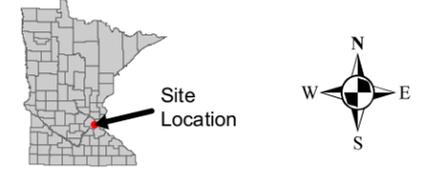

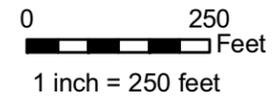

4.2.1 SHPO Inventory

Using data from the SHPO inventory database, 210 individually inventoried properties are located within the study area (Figure 4; Table 1). Many were inventoried as a result of the historic resource surveys that have taken place within the study area, as noted in Section 3.1, although a large number of resources have been inventoried in early (1980s) statewide inventory efforts or through other non-systematic or anecdotal inventory events. When the latter was the case, the “Survey” column is marked as N/A, or not applicable.

Listed properties have been entered into the NRHP through the official designation process. *Eligible* properties have been certified as eligible for listing in the NRHP through the Minnesota SHPO, usually as the result of a systematic survey completed for a Section 106 review. For the purposes of Section 106, properties determined eligible are treated in the same manner as those properties that are actually listed in the NRHP. Most properties that have not been listed in or determined eligible for the NRHP would generally be considered *Unevaluated* for their eligibility. However, because of the relatively recent and comprehensive survey work that has occurred within the study area for Section 106-reviewed work, many properties can confidently be considered *Not Eligible* for listing; these properties have been surveyed within the past decade and reviewed by a federal agency, with SHPO concurrence that they are not eligible for listing in the NRHP. It should be noted, however, that the Lake Street survey limited the evaluation of properties solely within the context of Lake Street commercial corridor; some properties found to be not eligible in that survey *may* be found eligible within other historic contexts. In addition, the passage of time, further investigation, and different research directives may indicate that properties once recommended as not eligible, may indeed be considered as significant historic resources.

4.2.2 NRHP Properties

Four properties within the study area are individually listed in the NRHP:

- Sears, Roebuck and Company Building, HE-MPC-3517
- Minneapolis Pioneers and Soldiers Memorial Cemetery (Layman's Cemetery), HE-MPC-4123
- Swan J. Turnblad House, HE-MPC-4218
- Bardwell-Ferrant House, HE-MPC-4232

In addition, the Chicago, Milwaukee and St. Paul Railroad Grade Separation historic district, which includes 48 contributing and non-contributing buildings and structures, is partially located within the study area.

The following properties are eligible for listing in the NRHP:

- Stewart-Cepro Grain Elevator, HE-MPC-0625 (Demolished)
- Goodlund Rowhouse, HE-MPC-13782
- South Side Destructor, HE-MPC-3504
- Northern States Power Hiawatha Substation, HE-MPC-4107
- Avalon Theater, HE-MPC-4116
- Zinsmaster Baking Company, HE-MPC-4220
- W.J. Jennison House, HE-MPC-4234

A total of 134 properties were found not eligible for listing in the NRHP through Section 106-reviewed survey projects.

4.2.3 Minneapolis HPC Inventory

In 1972, Minneapolis established Minnesota's first heritage preservation commission (HPC) as a way to locally designate and regulate historic landmarks and districts within the city. In 1980, the Center for Urban and Regional Affairs at the University of Minnesota received a contract from the city to carry out an architectural and historical study of the city as part of an effort to identify buildings and areas for heritage preservation protection. The study resulted in the so-called "800 List," and has served in part as

the basis for designation activities on the HPC for over two decades. Although some properties have subsequently become designated or listed on the NRHP, many from the original list remain undesignated. They are, however, considered by the city to be properties of importance and would receive special attention in historical reviews. Twenty-four properties from the early “800 List” are within the study area:

- 2812-14 11th Ave S. Brick Queen Anne House
- 2641 13th Ave S. Eastlake/Queen Anne House
- 2631 14th Ave S. Eastlake/Queen Anne House
- 3019 17th Ave S. Faith Lutheran Church
- 3027-3043 17th Ave S. Brick Worker’s Cottages
- 2536 18th Ave S. Craftsman Cottage
- 2647 Bloomington Ave Oliver Presbyterian Church
- 3056 Bloomington Ave Commercial Building (wire brick)
- 2546 Cedar Ave Queen Anne Dwelling
- 3024 Cedar Ave Brick & Stone Queen Anne Dwelling
- 3107 Cedar Ave Clapboard Farmhouse
- 3045 Chicago Ave Mount Olive Lutheran Church
- 2843-2929 Elliot Ave Sears, Roebuck & Co. (now NRHP listed)
- 3112 Elliot Ave Eastlake/Queen Anne Dwelling
- 1626-30 E. Lake St Gustavus Adolphus Hall (now demolished)
- 1700 E. Lake St. Phillips 66 Gas Station
- 1701-07 E. Lake St. Glass-front Commercial Block
- 3044 Longfellow Ave Church of the Nazarene
- 3010 Minnehaha Ave Former Fire Station #21
- 2520 Park Ave Georgian Revival Dwelling
- 2722 Park Ave Brick Colonial Revival Dwelling
- 2523 Portland Ave Ebenezer Tower
- 2546 Portland Ave Chateausque Dwelling
- 2709-11 Portland Colonial Revival Duplex

For the purposes of local planning and designation, the City of Minneapolis, through its HPC, continued to conduct historic resource surveys. As noted in Section 3.1, URS/BRW conducted a survey of four neighborhoods that included most of the Hiawatha Project study area in 2001. The survey documented at various levels nearly every parcel, even vacant lots. Properties were assigned three survey categories: 1) No Significance, 2) Possible Significance/No Integrity, and 3) Possible Significance. Within the study area, 2,461 parcels were inventoried; 682 were recommended as having no significance, 157 with possible significance, but no integrity, and 1,622 with possible significance (see Appendix A). Because properties were not assigned SHPO inventory numbers (unless previously assigned), they largely remain exclusive from the SHPO inventory properties.

Because of the broad, but shallow approach to the survey, data are perhaps only useful in terms of what was found to hold no significance or no integrity. This still leaves over 65 percent of the surveyed properties as having some potential for historic significance; it is likely that only a small fraction of those properties would possess qualities that make it eligible for the NRHP.

The Principal Investigator of the survey did recommend several areas and property types that had the greatest potential for meeting either local or NRHP criteria for designation, including:

- 3027-3034 17th Avenue S. – an early group of brick workers housing;
- Powderhorn Lake and Park and the 3100 block of 11th Avenue S. and 3100 through 3500 blocks of 10th Avenue S. – large, single-family dwellings that could be related to the park and may have been home to significant persons in the development of the area;
- Apartment flats on Powderhorn Terrace and 12th Avenue S. north of the park, 14th Avenue S. east of the park, and others throughout the neighborhood;
- 1700 block of E. 31st Street – a series of four paraged stone houses that are unique to the neighborhood; and
- East Lake Street commercial corridor.

With the exception of the East Lake Street commercial corridor, these areas of interest would likely continue to have potential for historic significance (field investigation was not conducted to assess current integrity and condition). As for East Lake Street, the later and more complete survey conducted in 2002 supplants the recommendations made in the URS/BRW study. These later recommendations concluded that East Lake Street did not have sufficient integrity for a historic commercial corridor, although a number of properties were individually eligible or within smaller clusters at commercial nodes.

4.2.4 Other Sources of Potential Architectural History Properties

Recent interest has been raised regarding a previously unrecorded property within the study area. The house located at 3009 Park Avenue S. is purported to be the home of Pauline and Thomane Fjelde, two Norwegian immigrant sisters who sewed the first Minnesota flag. The current owner wants to demolish the house, but local residents support its preservation. The issue is currently being considered by the Minneapolis HPC (*Star Tribune* 13 December 2008).

The area east of Chicago Avenue was the home of many low-income Swedish and Norwegian immigrants; remnants of that heritage can be found in the churches and other institutions that remain in the neighborhood. Further investigation may indicate a significant social history represented in the residential district.

4.2.5 Notes on Integrity and Current Conditions

Conclusions made in previous investigations, whether for eligibility, non-eligibility, or possible significance, may be affected by time and intervening conditions. Since historic integrity is one factor in determining the eligibility of a property for the NRHP or local designation, changes to integrity can affect current assessments. Changes may occur in either direction. A property found to be eligible in a previous assessment might have been altered since that time rendering it not eligible for listing. Similarly, properties that were considered to have potential historic significance, but whose loss of integrity prevented it from being an eligible property, may have had the offending alteration removed or

otherwise changed so as to make the property eligible. Only further investigation and field survey can assess the current integrity of individual properties.

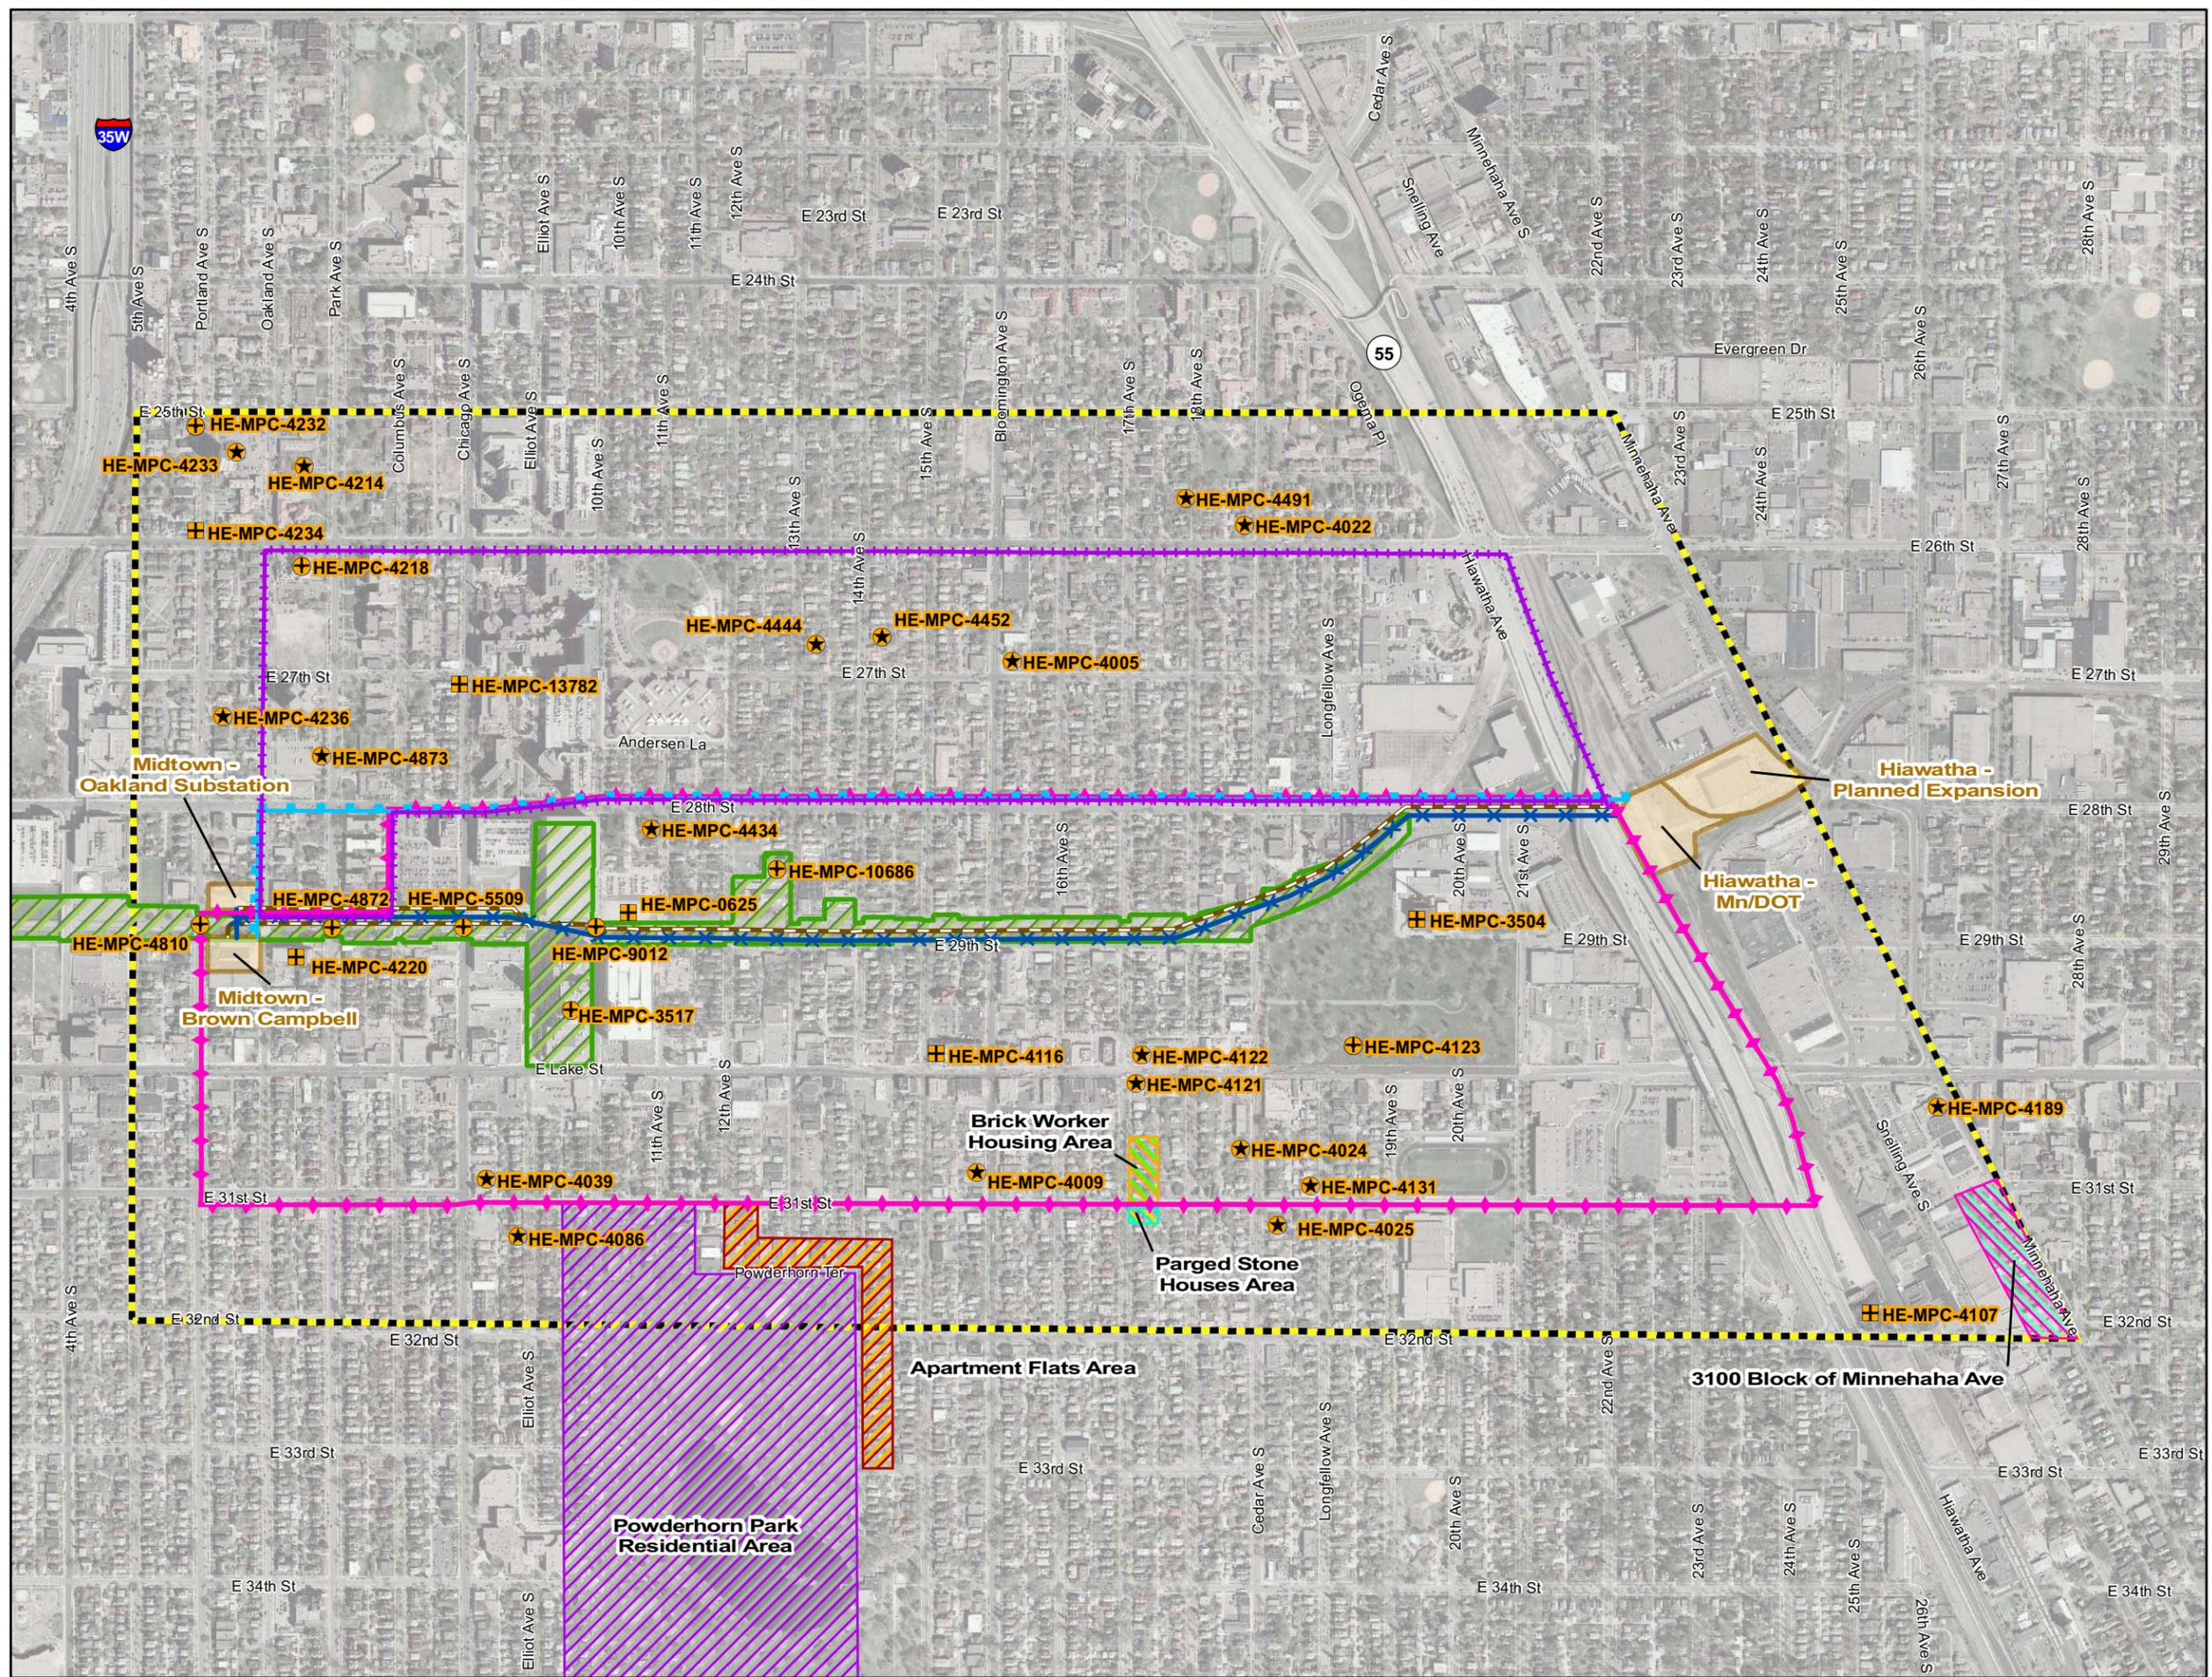

4.2.6 Architectural History Potential

Based on research on the contextual history of the study area, previous investigations, NRHP listed and eligible properties, the “800 List” of potentially eligible properties, and other inventoried properties resources, a summary of known and unknown potential historic properties, themes and locations of architectural history properties can be developed. The following themes have been identified as possessing potential for historic associations within the study area:

1. Between 1880 and 1920 historic occupants of the study area ranged from wealthy citizens who erected large, high-style mansions along Park Avenue, middle-class families who established homes in the Powderhorn Park neighborhood, to workers from the local industries who were housed in modest cottages in the Phillips neighborhood. Good examples of residences representing these associations may have potential significance.
2. Portions of the study area were popular enclaves for Swedish and Norwegian immigrant communities. Examples of houses, churches, social institutions and districts representing these associations have potential historic significance.
3. The study area contains remnants of important industries, including the Minneapolis Moline plant, the nearby Honeywell facility, and the CM&StP rail yards, which employed many residents of the study area. Intact remnants of these industries or ancillary businesses or dwellings may have historic significance.
4. Important historic and cultural institutions and facilities, such as churches, social halls, theaters, and hospitals are within the study area and may have historic significance.
5. The study area was shaped by transportation systems, including the CM&StP Benton Cutoff and grade separation, the convergence of rail lines in the vicinity of Hiawatha and E. 28th Street, the streetcar lines which traversed Lake Street and several north-south routes, and later the construction of Interstate 35W just to the west of the study area. Related resources may have historic significance.

Where possible, these areas have been mapped to illustrate the Areas of Sensitivity for architectural history resources (Figure 5). The following areas and properties have been identified as potentially historic:

1. Lake Street served as an important commercial corridor; several properties are listed in or eligible for the NHRP, although many have been determined not eligible in a recent survey, others were found to be eligible.
2. The study area contains four individual properties listed in the NRHP and one historic district, the CM&StP Railroad Grade Separation district, which bisects the study area.
3. The study area contains seven properties that have been determined eligible for listing in the NRHP; one is demolished.
4. Six properties are locally designated by the Minneapolis HPC.

Map adapted from USGS High Resolution Orthoimagery for the Minneapolis-St. Paul, Minnesota Urban Area, 2006.

5. Twenty-four properties within the study area were identified as potentially significant properties on the Minneapolis “800 List.”
6. Properties in the 3000 block of 17th Avenue South have been recommended as an important representation of brick workers housing.
7. Powderhorn Lake and Park and the 3100 block of 11th Avenue South and 3100 through 3500 blocks of 10th Avenue South may have significant associations with the local development.
8. Apartment flats on Powderhorn Terrace and 12th Avenue South north of Powderhorn Park, 14th Avenue South east of the park, and others throughout the neighborhood have potential for NRHP listing or local designation.
9. The 1700 block of East 31st Street contains a series of four paraged stone houses that are unique to the neighborhood and may be historically significant.
10. A grouping of residences on the 3100 block of Minnehaha Avenue may possess historic significance as important examples of early twentieth century worker cottages built for employees of the nearby Minneapolis Steel and Machinery Company.
11. In addition to the above-referenced findings, the 2000 URS/BRW survey, which included most of the study area, recommended that over 1,600 properties have the potential to possess some level of historic significance (see Appendix A). While more intensive investigation would likely indicate that only a small fraction of those properties would be considered eligible for local designation or NRHP listing, it is a strong suggestion of the historical sensitivity and potential of the area.

4.3 PRECONTACT ARCHAEOLOGY

The literature search indicated that no precontact archaeological sites have been previously recorded within the study area.

4.3.1 Precontact Archaeological Potential

The USGS topographic map of the study area indicates that it is a relatively level area with occasional light undulations. At the time of the original GLO survey in 1853, the study area was occupied entirely by prairie land, and it was located approximately one mile northwest of a large wetland, and 1-1/8 to 1-1/2 miles west of the Mississippi River, these constituting the nearest water source and wetland to the study area (GLO 1876). Powderhorn Lake is not depicted on the GLO survey map or on an 1874 map of the area, indicating that it was artificially created sometime between 1874 and 1879, when it appears on a city map (Andreas 1874; Warner and Foote 1879).

Because the study area historically did not exhibit any topographically prominent features and was located at a considerable distance from any water sources or wetlands, it is considered to have low potential for containing precontact archaeological resources. Further, based on the substantial urban development that has occurred in the study area since the precontact period, it is unlikely that any potential precontact archaeological resources would remain intact.

4.4 HISTORICAL ARCHAEOLOGY

The literature search indicated that no historical archaeological sites have been previously recorded within the study area.

4.4.1 Historical Archaeological Potential

Based on the pre-urbanization landscape of the study area, as described in Section 4.3.1, early (pre-1850) historical archaeological sites are not likely to be present within the study area. Although an agricultural field was recorded during the GLO survey as being present in the study area in 1853, no buildings or other features were drawn in association with it. While a review of the notes associated with the survey might indicate that the fields were in fact associated with an early farmstead in the study area, the extent of subsequent impacts to the landscape make it improbable that significant archaeological resources associated with such an occupation survive. Most potential historical archaeological sites in the study area would likely date to the period of urbanization, which began largely during the mid 1870s when streetcar lines began to be built into the study area (Vermeer and Stark 2003), but the possibility of slightly earlier sites cannot be discounted, given that at least a few still-extant residences were established in the study area by the 1850s and 1860s, and at least one industrial concern, the Minneapolis Harvester Works, was constructed at Hiawatha and Lake in 1873 (SHPO database; Pearson and Roise 2000:7).

Although historical archaeological sites may be present for all periods slightly before and during the urbanization of South Minneapolis, those dating between 1850 through the end of the nineteenth century are more likely to be significant. Regular trash collection was probably not available to everyone during this period, and privies were still in wide usage throughout much of Minneapolis through 1900 (Pearson and Roise 2000:15), which would result in less material culture being transported offsite, leaving a more dense and informative archaeological signature.

Occupations within the study area during the period of its urbanization can be generalized into one of the following categories: commercial, industrial, infrastructural, institutional, recreational/social, and residential. The conditions under which historical archaeological sites associated with each type of occupation are more likely or less likely to be present within the study area and potentially significant are discussed by category below. For those types of occupations for which sites might be encountered within the study area, methods that could be used to identify them are also presented.

4.4.1.1 Commercial

Commercial occupations are those related to the provision of goods and services to consumers for payment. Here, commercial occupations do not include the provision of services that involve the repair, processing, or manufacture of material items, such as a blacksmith shop or butcher shop, which are included in the “industrial” category. Commercial occupations were present in limited instances along Lake Street by the early 1880s, with nodes located at streetcar line crossings at Minnehaha, Cedar, Bloomington, and Chicago Avenues (Minneapolis Public Library 2001:1).

Beginning circa 1890, commercial growth skyrocketed, particularly along Lake Street, and by 1906, commercial enterprises existed on the majority of blocks along Lake Street between Cedar and 5th Avenues, as well as between Minnehaha and Snelling, and Hiawatha and 23rd. These enterprises extended north and/or south from Lake Street for a couple of blocks in several locations, particularly from Cedar to 15th and Portland to 5th Avenues, though they were generally not as concentrated as they were along Lake Street. In addition, stores and other commercial buildings are depicted on the 1906 fire insurance map of the area on 25th and 26th Streets between Bloomington and 15th Avenues; 26th Street between 14th and 13th Avenues; 27th Street between 16th and Bloomington, 14th and 13th, and Elliot and Chicago Avenues; 28th Street between 16th and Bloomington and 12th and 11th Avenues; 29th Street between 13th and 12th and Elliot and Chicago Avenues; 31st Street between Cedar and 18th, Bloomington and 15th, and Chicago and Columbus Avenues; and on 32nd Street between 20th and 19th and 16th and Bloomington Avenues (Rascher 1906). Later fire insurance maps date to 1912, 1924, and 1952, and these indicate continued growth in the commercial sector throughout the period encompassing those years, so that by 1952, the majority of the blocks in the study area contained commercial occupations, though these were often interspersed with other occupation types on a given block (Sanborn 1912, 1924, 1952).

The commercial occupations in the study area can be broken down into two types. The first involves the provision of goods for payment (retail), the purpose of which was to move goods out of the building and into the hands of customers, making it unlikely that related material culture would be present to any major extent in the archaeological record. The second involves the provision of services that did not rely on a material component, such as a law office, which also would not have a strong archaeological signature. Although the owners of such enterprises may have lived in the same building as their businesses, such as in a second-story apartment, material culture associated with the residential occupation does not pertain to the commercial category, and would fall under “residential,” as discussed below. Although the foundations of commercial buildings may remain intact under parking lots or vacant locations within the study area, these alone would not represent any events or patterns of historical significance or provide important information. Based, therefore, on the period in which they operated and the nature of their operations, the commercial occupations within the study area are unlikely to have created an archaeological signature that would either represent the pattern of commercial growth or urbanization in South Minneapolis or answer important research questions. Archaeological resources associated with commercial occupations in the study area are therefore not likely to meet the NRHP criteria for significance.

Historical fire insurance maps often do not specifically label non-residential buildings, instead using general terms such as “store” or “office.” For this reason, to identify a particular location within the study area as having been a site of only commercial occupation, in-depth research, which should include but may not be limited to a review of historical city directories in conjunction with historical maps, should be conducted.

4.4.1.2 Industrial

Industrial occupations, those related to the manufacture, processing, repair, and associated transportation of goods and/or raw materials, occurred in the study area on a variety of scales, ranging from the small corner cabinet shop to the enormous Minneapolis Moline Power Implement Co. plant. Most of the large industrial concerns that were present in the study area arrived during or after the early 1880s, after the construction of the CM&StP railroad made possible the transportation of their products, though it is known that the Minneapolis Harvester Works, which manufactured farm machinery, was established in the study area by 1873. Based on the need to transport products, it is likely that most of the smaller industries entered the study area at this time as well, though small-scale industrial operations, such as tailor shops or carpenter shops, may have been present in some of the earlier-established commercial nodes near and on Lake Street.

The majority of the industrial occupation of the study area occurred at the east end between Minnehaha and Hiawatha Avenues, and along the CM&StP rail line that ran largely parallel to and north of 29th Street. Other, small-scale industries were present along Lake Street or lightly sprinkled throughout the study area.

Industrial occupations within the study area can be broken down into three types. The first involves large-scale production and manufacture. Archaeological resources associated with this type may include but are not limited to a complement of foundations, subsurface technological components, and artifacts generated either by industrial processes or workers, which could provide information on industrial operations such as layout, technologies used and their effectiveness, and worker habits, particularly with regard to those early industrial concerns that are lacking in documentation.

The second type involves small-scale manufacture, processing, or repair of goods or raw materials. Like their larger counterparts, these sites may provide information on industrial operations, but they may also provide information on the consumers who patronized the study area. As a strongly generalized example, a site associated with an early tailor shop may contain a relatively large number of hand-painted porcelain buttons as compared to plain clay buttons, indicating that the tailor catered to a wealthier clientele.

For these types of occupations, the first step in identifying whether potentially eligible archaeological resources might be present would be to obtain historic contextual information on the relevant industry as a whole and on the specific industrial occupation within the study area as a basis for assessing potential historical significance. If this information suggests that the occupation was not historically significant, either to the urbanization of South Minneapolis or as a local or regional expression of the industry, then associated archaeological resources would not likely meet the NRHP criteria for significance.

If, however, the occupation appears to have been historically significant, research on the history of the built environment in the location of the industrial occupation, including a visual inspection of current conditions, should be conducted to assess whether resources are likely to be intact. If, for example, an industrial building incorporated below-ground technologies, but the building was subsequently re-

purposed and the subsurface portion converted to apartments, then archaeological resources related to the industrial occupation were removed. If, however, the area in which the occupation was located was subsequently the site of only a vacant lot or a parking lot, then the probability that buried intact resources are present is higher.

If the potential for significant and intact archaeological resources to be present exists, a field survey should be conducted to identify such resources. For industrial sites, an initial walkover may be conducted to identify foundations or other features that might be present, but in cases where such features are completely obscured by vegetation, pavement, or another form of ground cover, backhoe trenching in the projected location of the footprint of the facility is generally needed to determine whether resources are present.

The third type of industrial occupation that was present within the study area is that related to the CM&StP railroad, specifically the area of the rail yard, which was tied to the transportation of industrial products. A comparison of historical and current aerial photographs indicates that the area formerly occupied by the rail yard has been completely altered by the construction of Trunk Highway 55 and numerous modern industrial buildings. Any potential archaeological resources associated with this type of occupation within the study area are therefore unlikely to retain sufficient integrity to be eligible for listing in the NRHP, and therefore no archaeological work is recommended for the former location of the rail yard.

4.4.1.3 Infrastructural

Infrastructural occupations, those related to the basic facilities needed to support the city, identifiable within the study area on historical maps include the storage yards of the City of Minneapolis Sewer Department and Water and Bridge Department, located on the south side of 26th Street, west of Hiawatha Avenue; the streetcar barn and storage yard for the Twin City Rapid Transit Company, located on the north side of Lake Street between 23rd and 21st Avenues; Layman's Cemetery, located north of Lake Street between 21st and Cedar Avenues; the South Side Destructor, located north of 29th Street and east of 19th Avenue; a substation for the Twin City Rapid Transit Co., located south of Lake Street between Chicago and Columbus Avenues; two fire stations, Fire Station No. 21, located on Minnehaha Avenue south of Lake Street, and Fire Station No. 13 on 17th Avenue between 25th and 26th Streets; and a post office, located on Bloomington Avenue between Lake and 31st Streets.

Based on a comparison of current aerial photographs with historical maps, Fire Station No. 21, the buildings that were present in the city storage yards (the materials were stored above ground), Layman's Cemetery, the South Side Destructor, and the post office are extant. The Extra Alarm Association of the Twin Cities (Extra Alarm) website (<http://www.extraalarm.org>), which contains information on the history of Twin Cities fire stations, shows that Fire Station No. 21 is now used as a community performance space.

The Twin City Rapid Transit Company streetcar barn has been razed, and its location is now occupied by two small buildings and part of a parking lot. The associated streetcar storage yard is occupied by another part of the same parking lot and a complex of large, more recently constructed buildings. The

storage yard, essentially a large parking lot for streetcars, is not likely to have created an associated archaeological site. It is possible, however, that a subsurface component of the streetcar barn (station) is present, given that the subsurface component of the Twin City Rapid Transit Company's East Seventh Street station was discovered under a parking lot in St. Paul in 2007 (Vermeer 2007). The Twin City Rapid Transit Company substation has also been removed, and is now occupied by a parking lot. More in-depth research into the operations of the substation would be needed to assess what, if any, types of archaeological resources might be associated with it.

Fire Station No. 13 has been razed. The Extra Alarm website indicates that the station was built in 1887 and razed in 1932. Current aerial photographs show that although a building has been constructed on the lot formerly occupied by the fire station, the western half of the lot, which was occupied by the back of the fire station and a small outbuilding, is vacant. Given the early end of its dates of occupation, it is possible that a privy was present on the property.

For both the Twin City Rapid Transit Company occupations and Fire Station No. 13, the first step in identifying whether potentially eligible archaeological resources might be present would be to obtain historic contextual information as a basis for assessing potential historical significance. If an occupation appears to have been historically significant, research on the history of the built environment in the location of that occupation, including a review of building permits and a visual inspection of current conditions, should be conducted to assess whether any construction or other disturbance occurred between, for the fire station, the razing of the fire station and the presence of the vacant portion of the associated lot and for the Twin City Rapid Transit Company, between the razing of the station or substation and the creation of the parking lots.

If no construction or other substantial disturbance has occurred, then the potential for significant and intact archaeological resources to be present exists, and a field survey should be conducted to identify such resources. In any of the three cases, backhoe trenching in those areas most likely to contain archaeological resources (the footprint of the Twin City Rapid Transit Company buildings and the rear of the fire station) would be needed to determine whether resources are present.

4.4.1.4 Institutional

Institutional occupations, those related to organizations, establishments, foundations, or societies devoted to the promotion of a public, educational, or charitable cause or program, occurred in the study area overwhelmingly as churches, but also as schools; temples; the American Institute of Swedish Arts, Literature, and Science; homes for the elderly; a hospital; the Good Templars hall; a clinic; Norway Hall; two YMCAs, and a youth center. With the exception of the hospitals, clinic, YMCAs, and homes for the elderly, the institutions in the study area were represented by buildings where people gathered for relatively short periods of time and then went home, which would not result in a strong archaeological signature. Archaeological resources associated with the institutional types would therefore not likely be eligible for listing in the NRHP. Archaeological resources relating to the convents and rectories associated with some of the study area's churches would fall under the category of "residential," as discussed below.

Based on a comparison of current aerial photographs and historical maps, the clinic, located on the east side of Bloomington Avenue between Lake and 31st Streets; the hospital (Abbot Northwestern), located north of 27th Street between Elliot and Chicago Avenues; and one of the homes for the elderly, located on the north side of 26th Street between Oakland and Portland Avenues are still extant. The other home for the elderly, located north of 27th Street east of Oakland Avenue, has been replaced by a new high-rise apartment complex and associated driveways. The home, according to the Sanborn map of 1952, was constructed in 1950. Based on its relatively late period of occupation and the level of disturbance that has since occurred, this location is unlikely to contain significant or intact archaeological resources. The YMCAs were both located on the south side of Lake Street, one on the east side of Longfellow Avenue, and the other on the west side of Park Avenue. Substantial more recent construction has occurred in the location of both, and both were constructed sometime between 1924 and 1952. These locations are therefore also unlikely to contain significant or intact archaeological resources.

4.4.1.5 Recreational/Social

Recreational/social occupations, which are just as the category name implies, occurred in the study area in two instances identified through a review of fire insurance maps, though certainly others may have been present over the years. The two identified occupations are the Minneapolis Curling Club, which was located on the east side of Portland Avenue, south of 29th Street, and the Democratic Club house, located on the north side of Lake Street, east of 16th Avenue. Both of these occupations were represented by buildings where people gathered for relatively short periods of time and then went home, which would not result in a strong archaeological signature. In addition, the Curling Club was subsequently converted to an auto sales and service building, and substantial more recent construction has occurred adjacent to it and in the location of the Democratic Club House. These locations are therefore unlikely to contain significant or intact archaeological resources.

4.4.1.6 Residential

Residential occupations, those related to the living spaces of individuals and families, occurred in the study area primarily as houses, duplexes, and apartments, but also as living spaces shared with stores, convents, and rectories. Residential occupations arose in a highly limited extent as early as the 1850s in the study area, and then increased exponentially over the period between the 1870s and 1920s as transportation needs were met and employment opportunities grew. They were present throughout the study area during the historical period, as they were often interspersed in blocks with other occupation types.

In general, later residential occupations, those dating to approximately 1910 or after, will not be as well represented archaeologically in the study area as earlier sites. By this time, the 1901 city law outlawing the construction of new privies had been passed, and new construction was required to be connected to sewer lines (Arnott 1996); water mains ran throughout the vast majority of the study area, eliminating the need for wells or cisterns (Kirk 1907); and the first ordinances regarding the disposal of organic waste were in place, though it should be noted that burning and burying of non-organic waste were still acceptable practices under city law until at least the early 1930s (Arnott 1996). Trash middens, privies, cisterns, wells, and other structures that often produce substantial amounts of data as archaeological

features, therefore, are more likely to have been present prior to 1910. Archaeological sites associated with residential occupations often comprise these types of features along with building foundations, and therefore they generally consist of the area located within, to the sides, and to the rear of the building footprint.

For residential occupations, the first step in identifying whether potentially eligible archaeological resources might be present would be to conduct deed and census research and review relevant secondary sources to reconstruct the history of occupancy and obtain information on the occupants' ethnic background, occupation, and socioeconomic status. In addition, historic contextual information should be obtained not only on the specific residence, but on the surrounding neighborhood to provide a basis for assessing significance. In some cases, the occupants may be historically significant individuals, making it likely that associated archaeological resources are potentially eligible for listing in the NRHP. If the occupants, however, do not readily stand out as individuals, they must also be considered under broad historical patterns: Were, for example, the occupants part of an ethnic enclave within the study area, and might therefore, associated archaeological resources provide information on the identity, assimilation, or maintenance of ethnic boundaries by that group? Are the occupants part of a working-class neighborhood, and might archaeological data tell us about their lifeways as opposed to those of the wealthier contingent within the study area? If the historical information suggests that the occupation was not a significant part of a broad historical pattern, then associated archaeological resources would not likely meet the NRHP criteria for significance.

If, however, the occupation appears to have been historically significant based on the occupants individually or as members of a group, research on the history of the built environment, including a visual inspection of current conditions, should be conducted to assess whether resources are likely to be intact. If an original house, for example, is still present, the layout of the lot remains largely unchanged, and extensive subsurface disturbance such as utility installation has not occurred along the sides and rear of the house, or if the original house has been taken down and the lot has since remained vacant, archaeological resources are more likely to be intact than if a new high-rise building has been constructed to take up the entire lot.

If the potential for significant and intact archaeological resources to be present exists, a field survey should be conducted to identify such resources. While shovel testing may be used as an initial means of identifying sheet middens or other artifact concentrations in areas where hand digging is possible, backhoe trenching is generally needed to determine whether foundations, privy pits, or other subsurface features are present, and it is typically a more efficient and reliable method for identifying sheet middens or other artifact concentrations in urban settings.

5.0 Conclusions

5.1 POTENTIAL EFFECTS TO CULTURAL RESOURCES

The proposed project has the potential to have effects to cultural resources, both direct and indirect. The PUC does not specify in what ways historic resources should be factored into the decision-making process. Further guidance, however, can be provided by federal regulations in Section 106 of the National Historic Preservation Act of 1966, which applies to federal undertakings. These guidelines suggest that an adverse effect may be found when an undertaking may alter, directly or indirectly, the characteristics of a historic property that qualify it for inclusion in the NRHP by diminishing its quality of integrity. Examples of adverse effects may include physical destruction or damage of all or part of a property, alteration of a property, removal of a property from its historic location, change of the character of the property's use or of physical features within the property's setting that contribute to its historic significance, or the introduction of visual, atmospheric or audible elements that diminish the integrity of the property's significant historic features (36 CFR Part 800.5: Protection of Historic Properties).

For overhead alternatives for the Hiawatha project, visual effects and effects to setting and landscapes would be the most broad-ranging of potential effects to architectural history resources. Generally, construction of a facility will not cause a visual adverse effect except where visual setting or visual elements are character-defining features of eligibility of a historic property located within the APE. Overhead alternatives may also have an effect to below-ground resources where tower structures are sited.

Underground alternatives would have the least impact to architectural history resources, but the greatest effect to potential archaeological resources. When sited within important historic landscapes, even underground placement of transmission lines could have the potential to disturb historic landscapes. Placing underground alternatives within previously disturbed and/or public right-of-ways is one way of minimizing the potential for adverse effects to archaeological resources. Placement within more sensitive areas may require further investigation to determine the presence and significance of archaeological resources.

Each of the proposed alternatives has both positive and negative aspects with regard to effects to known or potential historic resources. An analysis of the potential effects to architectural history and archaeological resources is provided below.

5.2 SUMMARY OF EFFECTS TO ARCHITECTURAL HISTORY RESOURCES

5.2.1 Transmission Lines – Underground Alternatives

Underground transmission lines would have minimal or no effects to most architectural history resources. As proposed, underground alternatives would be placed within right-of-ways and likely would not have adverse effects to architectural history properties or landscapes. The E. 29th Street underground alternative, however, runs parallel to, and possibly within the CM&StP Railroad Grade

Separation historic district (NRHP listed). While this underground alternative would remove the visual intrusions of overhead lines within this corridor, it could pose concerns related to the integrity of the historic district, depending on the final location of the line. Minor elements, such as historic retaining walls and fences, may be located within or near the proposed route, and are considered contributing historic features to the district. Further analysis would be necessary when detailed plans are made, should this alternative be selected. If the 29th Street underground option is selected by the PUC, Xcel would complete a cultural resources survey to further clarify the effects of the project on the historic district and other known and unknown cultural resources. Historically significant elements would be avoided and/or mitigated to the extent possible.

5.2.2 Transmission Lines – Overhead

Overhead transmission lines placed within right-of-ways would likely have indirect visual effects to historic resources and potential direct effects to cultural landscapes. Densely built up urban areas tend to limit the visual effects of tall structures. The height of the proposed towers – 75 to 100 feet – would require a buffered area of potential effects extending at least one city block, or 0.1 mile, in all directions. Field investigations could confirm if this proposed area would be sufficient. Ideally, an architectural history survey would be completed for the area of potential effect to determine which properties would be considered historically significant, and what effects may result from the proposed project. Since much of the study area has already been surveyed, even at a cursory level, an alternative may be to utilize the existing survey data to identify those properties that have been noted as possessing potential historic significance to narrow the possible resources as a basis of a survey. Alternatively, the properties designated with potential significance could be presumed to be NRHP-eligible, and an analysis of effects could be completed for those properties without further historical research.

The Proposed Route (29th Street overhead route) would have the potential to impact known historic resources, as it parallels the CM&StP Railroad Grade Separation historic district, the NRHP-listed Sears Building (HE-MPC-3517), the NRHP-eligible Zinsmaster Baking Company (HE-MPC-4220), the NRHP-listed Layman’s Cemetery (HE-MPC-4123), and the NRHP-eligible Southside Destructor (HE-MPC-3504). The district is characterized by industrial and transportation associations, so the proposed large transmission towers near the corridor are not entirely out of character. Still, the proposed alternative would introduce modern features within or near the historic district and would likely be considered an intrusive and adverse effect to the historic landscape. Similarly, the line could be considered an adverse effect on the Sears Building and the Zinsmaster Baking Company, depending on the locations of nearby towers.

The other overhead alternatives, including the 26th and 28th streets alternative and the 28th and 31st streets alternative, traverse more residential areas. While few properties within the immediate vicinity of 26th and 28th streets have been noted as having historic significance, it is also an area that has been less intensively surveyed. Of note is the NRHP-listed Swan Turnblad House (The American Swedish Institute; HE-MPC-4218) at the corner of E. 26th Street and Oakland Avenue – a critical intersection for the proposed 26th and 28th streets alternative. Other properties listed in the “800 List” are found immediately adjacent or near proposed routes, including houses at 2722 Park Avenue S. (HE-MPC-4873),

2812-14 11th Avenue S. (HE-MPC-4434), and 2546 Cedar (HE-MPC-4022). Several inventoried, but unevaluated properties are also within the vicinity of this alternative. The 28th and 31st streets alternative is routed near several historically sensitive resources at 31st Street, including the Powderhorn Park Residential Area, the Apartment Flats Area, the Brick Worker Housing Area, the Parged Stone Houses Area and several other potentially eligible properties that have the potential to have adverse visual effects.

5.2.3 Substations

Substation alternatives are proposed for the east end of the transmission line, near 28th Street between Minnehaha and Hiawatha Avenues, and the on the west end, on the west side of Oakland Avenue on the north or south side of the Midtown Greenway (see Figure 5). The east (Hiawatha) substation site would be located in an area that has been significantly redeveloped in recent years. It does not appear to contain historic properties or to be proximate to historically significant properties. Although rail spurs are extant within this area, it does not appear within the alignment of the CM&StP's main line of its Short Line route, an unevaluated rail corridor with potential historic significance. Most of the rail facilities within this area, such as the CM&StP rail yards, have been removed.

The west substation (Midtown) alternatives would be placed adjacent to the CM&StP Railroad Grade Separation historic district on its north or south side. The north site has been the location of a transformer yard since at least the 1950s. Construction of another transformer yard at this site would not have significant direct impacts to historic resources. The alternative proposed for the south side of the Midtown Greenway would be constructed on the site of a former auto sales and service building and curling club (HE-MPC-3519). This property was determined not eligible for the NRHP as part of the Midtown Greenway investigation. Immediately to the east is the Zinsmaster Baking Company (HE-MPC-4220), a property determined eligible for NRHP listing. The proposed high-profile substation, with an average height of 45 feet, would result in visual effects to surrounding properties for both the north and south alternatives. Many of the immediately surrounding properties have not been evaluated. Due to the sensitivity of the location, further survey of the surrounding parcels may be necessary to determine their potential historic significance. Landscaping or other screening devices appropriate to the industrial and residential setting of the substation may avoid or mitigate potential adverse effects to surrounding historic properties.

5.3 SUMMARY OF EFFECTS TO ARCHAEOLOGICAL RESOURCES

5.3.1 Transmission Lines

Currently, five alternatives for the transmission line are under consideration (see Figure 5). Although three of these alternatives would use overhead lines, because transmission towers will be constructed approximately every 400 feet, or closer, along those lines, the project would still result in subsurface impacts.

As currently planned, the alternatives run primarily east-west along E. 26th Street, E. 28th Street, E. 29th Street, and E. 31st Street within the existing rights of way for these streets, with portions running north-

south along Hiawatha Avenue, Columbus Avenue, Oakland Avenue and Portland Avenue within the existing rights of way for those streets. The rights of way were undoubtedly previously disturbed by road construction and the installation of other utilities, such as water mains, and are therefore unlikely to contain intact archaeological resources. Should construction be limited to these rights of way, no archaeological work would be recommended.

If construction will occur beyond the rights of way along these streets but in the front yards of buildings as they occurred historically, it would be located in areas with low archaeological potential, and no archaeological work would be recommended.

If, however, construction will occur beyond the rights of way along these streets, but not in a front yard, additional research as outlined for the category types above should be conducted to determine the need for archaeological survey.

5.3.2 Substations

On the east end, the proposed Hiawatha substation location extends north and south of 28th Street (see Figure 5). The north portion was previously occupied by the CM&StP shops and has been heavily disturbed by the construction of Trunk Highway 55 and new industrial construction. The south portion was occupied by multiple railroad tracks of the CM&StP, and is therefore not likely to contain archaeological resources. No archaeological work is therefore recommended for the east end substation as currently proposed.

On the west end, the proposed Midtown substation location north of the Midtown Greenway was historically occupied by a coal yard and coal bins and subsequently by a transformer yard, and it would therefore be unlikely to contain archaeological resources. The proposed substation location south of the Midtown Greenway is occupied by the former Minneapolis Curling Club. This location, as discussed in Section 4.4.1 under “Recreational/Social” is also considered to have low potential for containing archaeological resources. No archaeological work is therefore recommended for the west end substation as currently proposed.

5.4 FUTURE WORK

Xcel Energy has committed to conduct a cultural resource survey of the final transmission line route and substation locations as determined by the PUC in the route permitting process.

Appendix A: 2001 Minneapolis Study Data

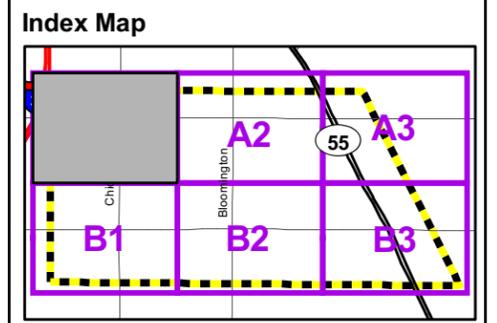

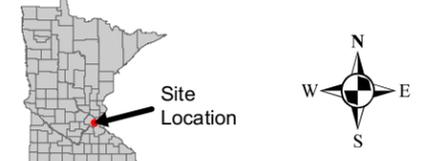

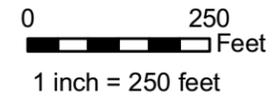

Notes on 2001 Minneapolis Survey Data

Summary data from the 2001 Minneapolis Survey is provided in table format (Table 2) and on maps (Figure A) in this Appendix. The purpose of including these items is to illustrate both the extent of the survey activity in the study area and the number of properties considered to have possible historic significance and integrity.

The 2001 survey did not include UTM coordinates to facilitate GIS mapping. Instead, geo-coding, based on addresses provided in reports, was used to provide the approximate locations of the surveyed properties for the maps. It should be emphasized that these maps are for illustrative purposes only to indicate broad patterns. The locations of properties are only approximate and each property has not been checked for accuracy. Also, a small number of properties were unable to be geo-referenced and so are not included on the maps.

- Legend**
- Possible Significance/Integrity
 - Possible Significance/No Integrity
 - No Significance
 - Study Area
 - Chicago, Milwaukee & St. Paul Short Line RR (Not Eligible)
 - CM&StP Grade Separation Historic District (Listed)
