# Stop Enbridge Oil and Tar Sands Pipeline Expansions

PL6668/PPL-13-474 and PPL-15-137

SIERRA CLUB
NORTH STAR CHAPTER

Dear Minnesota Department of Commerce,

I urge you to conduct a robust scoping process for Enbridge's proposed Sandpiper pipeline and Line 3 'replacement' project. This scoping process should take into account the cumulative impacts of approving these two projects on communities, tribal lands, our lakes and rivers, and the climate. The Sandpiper pipeline and the 'replacement' of Line 3 (which is in fact a new pipeline) would carry a maximum of 1.4 million barrels of oil per day (bpd) across Minnesota. An increase in oil transported through our state carries an increase in risk, and these risks must be comprehensively evaluated along with the need for this pollutant through the scoping period.

A recently report from the National Academy of Sciences found that cleaning up a tar sands spill in a waterway is significantly more difficult and potentially up to 14.5 times more expensive than cleaning up a non-tar sands oil spill. The disastrous 2010 Enbridge Line 6B tar sands spill in Michigan made it clear that even a smaller rupture with a quicker response time in the Mississippi River could be devastating. The DOC needs to scrutinize how spills would be cleaned up, the permanent damage to waterways, the impacts to Minnesota's economy, and its threat to the Ojibwe culture and wild rice rights.

I call on the Minnesota Department of Commerce to ensure a robust scoping process is conducted that takes into account the risks and potential impact of these pipeline expansions on water, communities, and climate.

# Stop Enbridge Oil and Tar Sands Pipeline Expansions

PL6668/PPL-13-474 and PPL-15-137

SIERRA CLUB
NORTH STAR CHAPTER

Dear Minnesota Department of Commerce,

I urge you to conduct a robust scoping process for Enbridge's proposed Sandpiper pipeline and Line 3 'replacement' project. This scoping process should take into account the cumulative impacts of approving these two projects on communities, tribal lands, our lakes and rivers, and the climate. The Sandpiper pipeline and the 'replacement' of Line 3 (which is in fact a new pipeline) would carry a maximum of 1.4 million barrels of oil per day (bpd) across Minnesota. An increase in oil transported through our state carries an increase in risk, and these risks must be comprehensively evaluated along with the need for this pollutant through the scoping period.

A recently report from the National Academy of Sciences found that cleaning up a tar sands spill in a waterway is significantly more difficult and potentially up to 14.5 times more expensive than cleaning up a non-tar sands oil spill. The disastrous 2010 Enbridge Line 6B tar sands spill in Michigan made it clear that even a smaller rupture with a quicker response time in the Mississippi River could be devastating. The DOC needs to scrutinize how spills would be cleaned up, the permanent damage to waterways, the impacts to Minnesota's economy, and its threat to the Ojibwe culture and wild rice rights.

I call on the Minnesota Department of Commerce to ensure a robust scoping process is conducted that takes into account the risks and potential impact of these pipeline expansions on water, communities, and climate.

# Stop Enbridge Oil and Tar Sands Pipeline Expansions

PL6668/PPL-13-474 and PPL-15-137

SIERRA CLUB
NORTH STAR CHAPTER

Dear Minnesota Department of Commerce,

I urge you to conduct a robust scoping process for Enbridge's proposed Sandpiper pipeline and Line 3 'replacement' project. This scoping process should take into account the cumulative impacts of approving these two projects on communities, tribal lands, our lakes and rivers, and the climate. The Sandpiper pipeline and the 'replacement' of Line 3 (which is in fact a new pipeline) would carry a maximum of 1.4 million barrels of oil per day (bpd) across Minnesota. An increase in oil transported through our state carries an increase in risk, and these risks must be comprehensively evaluated along with the need for this pollutant through the scoping period.

A recently report from the National Academy of Sciences found that cleaning up a tar sands spill in a waterway is significantly more difficult and potentially up to 14.5 times more expensive than cleaning up a non-tar sands oil spill. The disastrous 2010 Enbridge Line 6B tar sands spill in Michigan made it clear that even a smaller rupture with a quicker response time in the Mississippi River could be devastating. The DOC needs to scrutinize how spills would be cleaned up, the permanent damage to waterways, the impacts to Minnesota's economy, and its threat to the Ojibwe culture and wild rice rights.

I call on the Minnesota Department of Commerce to ensure a robust scoping process is conducted that takes into account the risks and potential impact of these pipeline expansions on water, communities, and climate.

The Sandpiper pipeline and the 'replacement' of Line 3 (which is in fact a new pipeline) would carry a maximum of 1.4 million barrels of oil per day (bpd) across Minnesota. An increase in oil transported through our state carries an increase in risk, and these risks must be comprehensively evaluated along with the need for this pollutant through the scoping period.

A recently report from the National Academy of Sciences found that cleaning up a tar sands spill in a waterway is significantly more difficult and potentially up to 14.5 times more expensive than cleaning up a non-tar sands oil spill. The disastrous 2010 Enbridge Line 6B tar sands spill in Michigan made it clear that even a smaller rupture with a quicker response time in the Mississippi River could be devastating. The DOC needs to scrutinize how spills would be cleaned up, the permanent damage to waterways, the impacts to Minnesota's economy, and its threat to the Ojibwe culture and wild rice rights.

I call on the Minnesota Department of Commerce to ensure a robust scoping process is conducted that takes into account the risks and potential impact of these pipeline expansions on water, communities, and climate.

# Stop Enbridge Oil and Tar Sands Pipeline Expansions

PL6668/PPL-13-474 and PPL-15-137

SIERRA CLUB
NORTH STAR CHAPTER

Dear Minnesota Department of Commerce,

I urge you to conduct a robust scoping process for Enbridge's proposed Sandpiper pipeline and Line 3 'replacement' project. This scoping process should take into account the cumulative impacts of approving these two projects on communities, tribal lands, our lakes and rivers, and the climate. The Sandpiper pipeline and the 'replacement' of Line 3 (which is in fact a new pipeline) would carry a maximum of 1.4 million barrels of oil per day (bpd) across Minnesota. An increase in oil transported through our state carries an increase in risk, and these risks must be comprehensively evaluated along with the need for this pollutant through the scoping period.

A recently report from the National Academy of Sciences found that cleaning up a tar sands spill in a waterway is significantly more difficult and potentially up to 14.5 times more expensive than cleaning up a non-tar sands oil spill. The disastrous 2010 Enbridge Line 6B tar sands spill in Michigan made it clear that even a smaller rupture with a quicker response time in the Mississippi River could be devastating. The DOC needs to scrutinize how spills would be cleaned up, the permanent damage to waterways, the impacts to Minnesota's economy, and its threat to the Ojibwe culture and wild rice rights.

I call on the Minnesota Department of Commerce to ensure a robust scoping process is conducted that takes into account the risks and potential impact of these pipeline expansions on water, communities, and climate.

A recently report from the National Academy of Sciences found that cleaning up a tar sands spill in a waterway is significantly more difficult and potentially up to 14.5 times more expensive than cleaning up a non-tar sands oil spill. The disastrous 2010 Enbridge Line 6B tar sands spill in Michigan made it clear that even a smaller rupture with a quicker response time in the Mississippi River could be devastating. The DOC needs to scrutinize how spills would be cleaned up, the permanent damage to waterways, the impacts to Minnesota's economy, and its threat to the Ojibwe culture and wild rice rights.

I call on the Minnesota Department of Commerce to ensure a robust scoping process is conducted that takes into account the risks and potential impact of these pipeline expansions on water, communities, and climate.

SIERRA CLUB
NORTH STAR CHAPTER

Dear Minnesota Department of Commerce,

I urge you to conduct a robust scoping process for Enbridge's proposed Sandpiper pipeline and Line 3 'replacement' project. This scoping process should take into account the cumulative impacts of approving these two projects on communities, tribal lands, our lakes and rivers, and the climate. The Sandpiper pipeline and the 'replacement' of Line 3 (which is in fact a new pipeline) would carry a maximum of 1.4 million barrels of oil per day (bpd) across Minnesota. An increase in oil transported through our state carries an increase in risk, and these risks must be comprehensively evaluated along with the need for this pollutant through the scoping period.

A recently report from the National Academy of Sciences found that cleaning up a tar sands spill in a waterway is significantly more difficult and potentially up to 14.5 times more expensive than cleaning up a non-tar sands oil spill. The disastrous 2010 Enbridge Line 6B tar sands spill in Michigan made it clear that even a smaller rupture with a quicker response time in the Mississippi River could be devastating. # Stop Enbridge Oil and Tar Sands Pipeline Expansions

PL6668/PPL-13-474 and PPL-15-137

SIERRA CLUB
NORTH STAR CHAPTER

Dear Minnesota Department of Commerce,

I urge you to conduct a robust scoping process for Enbridge's proposed Sandpiper pipeline and Line 3 'replacement' project. This scoping process should take into account the cumulative impacts of approving these two projects on communities, tribal lands, our lakes and rivers, and the climate. The Sandpiper pipeline and the 'replacement' of Line 3 (which is in fact a new pipeline) would carry a maximum of 1.4 million barrels of oil per day (bpd) across Minnesota. An increase in oil transported through our state carries an increase in risk, and these risks must be comprehensively evaluated along with the need for this pollutant through the scoping period.

A recently report from the National Academy of Sciences found that cleaning up a tar sands spill in a waterway is significantly more difficult and potentially up to 14.5 times more expensive than cleaning up a non-tar sands oil spill. The disastrous 2010 Enbridge Line 6B tar sands spill in Michigan made it clear that even a smaller rupture with a quicker response time in the Mississippi River could be devastating. The DOC needs to scrutinize how spills would be cleaned up, the permanent damage to waterways, the impacts to Minnesota's economy, and its threat to the Ojibwe culture and wild rice rights.

I call on the Minnesota Department of Commerce to ensure a robust scoping process is conducted that takes into account the risks and potential impact of these pipeline expansions on water, communities, and climate.

The DOC needs to scrutinize how spills would be cleaned up, the permanent damage to waterways, the impacts to Minnesota's economy, and its threat to the Ojibwe culture and wild rice rights.

I call on the Minnesota Department of Commerce to ensure a robust scoping process is conducted that takes into account the risks and potential impact of these pipeline expansions on water, communities, and climate.

# Stop Enbridge Oil and Tar Sands Pipeline Expansions

PL6668/PPL-13-474 and PPL-15-137

SIERRA CLUB
NORTH STAR CHAPTER

Dear Minnesota Department of Commerce,

I urge you to conduct a robust scoping process for Enbridge's proposed Sandpiper pipeline and Line 3 'replacement' project. This scoping process should take into account the cumulative impacts of approving these two projects on communities, tribal lands, our lakes and rivers, and the climate. The Sandpiper pipeline and the 'replacement' of Line 3 (which is in fact a new pipeline) would carry a maximum of 1.4 million barrels of oil per day (bpd) across Minnesota. An increase in oil transported through our state carries an increase in risk, and these risks must be comprehensively evaluated along with the need for this pollutant through the scoping period.

A recently report from the National Academy of Sciences found that cleaning up a tar sands spill in a waterway is significantly more difficult and potentially up to 14.5 times more expensive than cleaning up a non-tar sands oil spill. The disastrous 2010 Enbridge Line 6B tar sands spill in Michigan made it clear that even a smaller rupture with a quicker response time in the Mississippi River could be devastating. The DOC needs to scrutinize how spills would be cleaned up, the permanent damage to waterways, the impacts to Minnesota's economy, and its threat to the Ojibwe culture and wild rice rights.

I call on the Minnesota Department of Commerce to ensure a robust scoping process is conducted that takes into account the risks and potential impact of these pipeline expansions on water, communities, and climate.
