

MARCH 2025

# DEMOGRAPHIC TRENDS IN MINNESOTA HOMEOWNERSHIP

Jeff Howison, PhD

# Executive Summary

**This report examines historical homeownership data in Minnesota, with a particular focus on how trends have varied across different demographic groups.** We also provide newly released homeownership data for detailed racial and ethnic groups in Minnesota, providing a first look at the experience of smaller cultural communities for whom homeownership has not been well documented. Understanding the historical context of homeownership within diverse communities is crucial for addressing ongoing challenges related to housing equity, wealth disparities, and the creation of policies that foster greater access to homeownership for all Minnesotans.

## We find:

- In Minnesota, the current overall rate of homeownership is 72%, largely unchanged since 1970. However, this stability has masked divergent trends across various demographic groups.
- American Indian and Alaska Native homeownership is currently about 50%. The homeownership rate for Dakota households has risen significantly in the past decade.
- Since 1990, Minnesotans of Asian descent have made broad gains in homeownership across all age cohorts and across many detailed groups and countries of origin. Hmong homeownership has risen from about 10% in 1990 to about 60% in the latest data.
- Despite recent gains, Black or African American homeownership is less than half of the overall statewide rate and has fallen significantly over the long term. Some newer Black immigrant communities have made modest gains in homeownership, but those gains have not been realized by U.S.-born African Americans or by Minnesotans of Somali descent.
- Since 2000, Hispanic homeownership has risen from 45% to 53%. But from a longer-term perspective, these gains have been more modest due to the apparent declines that occurred in the 1990s.
- White homeownership is currently 77%, significantly higher than any other demographic group in Minnesota.

# Introduction and Data Source Notes

**The layout of the report is as follows: after an examination of overall statewide trends, data is presented for each of the (non-Hispanic) major race groups in Minnesota: American Indian and Alaska Native, Asian, Black or African American, and White, as well as for Hispanic Minnesotans (of any race).** Most of these sections contain three charts: one showing the overall homeownership rate across time, one showing homeownership trends for various detailed groups within those categories, and one showing changing patterns of age-specific homeownership rates. Due to issues concerning data availability and sampling reliability, some of the charts may contain empty cells or may be based upon different time periods.

All data refers to householders, defined as “the person, or one of the people, in whose name the home is owned, being bought, or rented,” as well as to households, “the related family members and all the unrelated people, if any... who share the housing unit.” The rate of homeownership in this report is defined as the number of householders who own the housing unit in which they live – either outright, or with a mortgage – divided by the total number of householders in a particular demographic group. The homeownership rate for Asian Minnesotans, for example, is calculated as the number of Asian householders who own their housing unit divided by the total number of Asian householders.

The data in this report comes from the programs and surveys conducted by the U.S. Census Bureau. Some of the data presented here comes from the decennial censuses—either a full count of all households in Minnesota or from a representative sample of households in the decennial census. Other numbers in this report come from the American Community Survey (ACS), the nation’s largest household survey with about 2 million U.S. households interviewed each year. In Minnesota, 63,000 households are surveyed annually. When possible, we report data from a single survey year; however, for many tabulations we use data combined from 5 years of the ACS to increase the stability of the estimate. Readers should be aware that while 5-year samples bring greater stability and reliability to the data, they cannot capture shorter-term, year-to-year fluctuations. For example, 1-year sample data from 2023 (the most recent available) indicates that Black or African American

homeownership has risen to 32%. However, this recent trend is not captured by the data presented here. Because the ACS estimates are from a sample rather than a full count of the population, there are margins of error associated with the data. In some instances, the margins of error are included in the charts. Some of the ACS data in this report was accessed using individual-level, publicly available ACS data from IPUMS-USA at the University of Minnesota (<https://usa.ipums.org/>). Each chart contains notes that reference these sources.

As a final introductory note, we should add that there is an abundance of housing-related data and reports published by state and local government agencies, organizations within the private sector, by academics, and by advocacy groups. The data presented here is meant to provide additional historical context to the wealth of existing knowledge on homeownership in Minnesota, so that it may be of use in these larger conversations.

**The appendix to this report contains the Census Bureau’s most comprehensive, detailed homeownership data for disaggregated race groups, known as the DHC-B file. Readers will find homeownership rates for many African, American Indian, Asian, European, and Hispanic detailed and regional groups.**

# Homeownership for All Minnesota Households

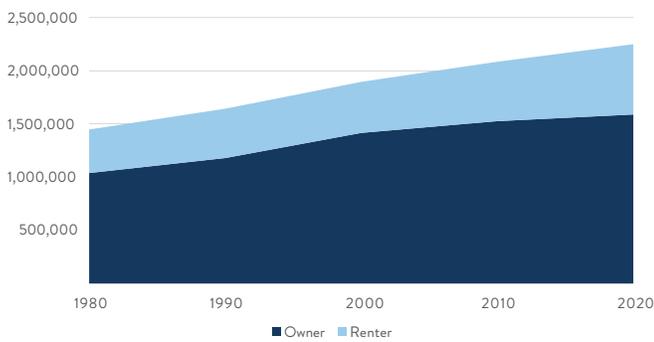

Reflecting the steady growth of Minnesota’s population, the number of households in our state has nearly doubled since 1970. In 1970, there were 1,153,946 households in Minnesota; in 2020, that figure had grown to 2,253,990, an increase of about 95%. During that time, the number of homeowners grew from 824,629 to 1,590,421. The number of households has increased faster than the state population, such that the average number of people per household has declined from 3.3 in 1970 to 2.5 in 2020.

In the broadest terms, homeownership in Minnesota has changed very little over time. In 1970, about 72% of Minnesotans owned their homes outright or with a mortgage. This overall rate of homeownership rose to 75% during the 1990s, before declining back to about 72% by 2023.

Likewise, for Minnesota as a whole there has been relative stability in age-specific rates of homeownership. In 1990, the broad pattern was an increasing rate of homeownership throughout the life course, from young adulthood through retirement, at which point homeownership gradually declines as older Minnesotans move in with family members, into more manageable apartments, or into retirement communities and other group quarters facilities. That general pattern is still observable, although the most recent data suggests homeownership is now somewhat lower for most age cohorts other than for those 65 and older.

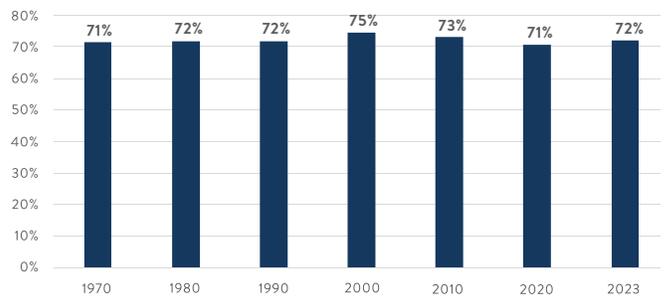

But these signs of long-term overall stability obscure other significant trends, including widening disparities among some demographic groups.

Sources: ipums.org, from U.S. Census Bureau, 1990 Decennial Census; 2018-2022 American Community Survey.

# Homeownership for American Indian and Alaska Native Households

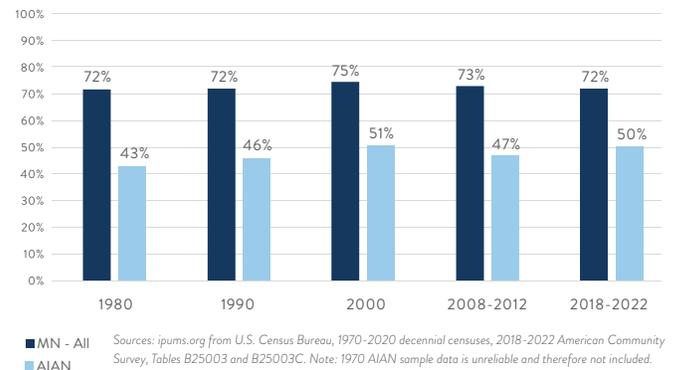

The number of households headed by an American Indian and Alaska Native (AIAN) householder increased from 7,561 in 1970, to 20,909 in 2020. During that time, the number of AIAN homeowners grew from 3,155 to 9,818.

Although overall AIAN homeownership has largely rebounded from its decline during the 2000s, the most recent data suggests it has not exceeded its 2000 peak.

**Chart 4. AIAN Householders by Housing Tenure**

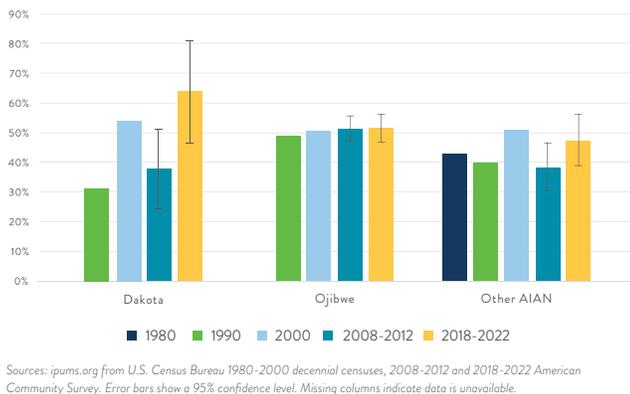

**Chart 5. Homeownership for American Indian and Alaska Native Minnesotans**

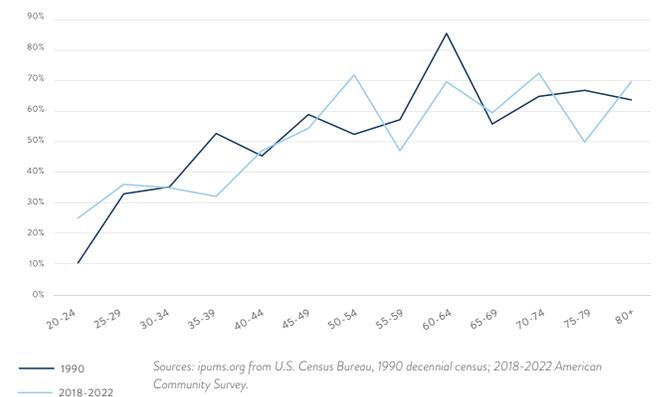

There is some variability in the longer-term trends for detailed AIAN tribes. Most recently, the rate of homeownership for Dakota households has increased from 38% to 64%. Likewise, the rate for “other” AIAN households also increased significantly, from 38% to 47%. This “other” category includes various Native American communities that are too small to disaggregate in the sample used here. (For complete homeownership data for all available detailed Native American groups – see the appendix of this document.)

A historic comparison of age-specific rates for AIAN homeowners shows continuity, with some exceptions. Specifically, the most recent rates are lower for those in the 35-to-39 and 75-to-79 cohorts, but higher for those in the 50-to-54 cohort. Overall, there is a general increase in homeownership that corresponds to aging through the life course.

**Chart 6. Detailed Homeownership Rates for AIAN Minnesotans**

**Chart 7. Age-Specific Homeownership for AIAN Minnesotans**

# Homeownership for Asian Households

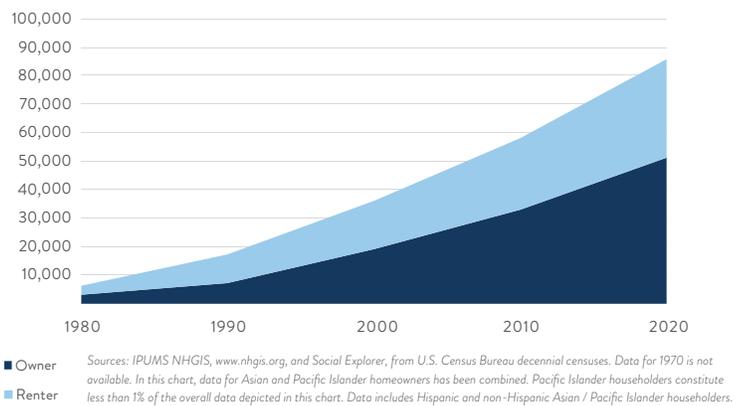

The number of households headed by Asian and Pacific Islander Minnesotans has increased dramatically, from 6,191 in 1980 to 85,757 in 2020 – an increase of nearly 1,300%. During that time, the number of Asian homeowners has increased from 3,153 to 51,127.

The most recent data indicates that the homeownership rate for Asian Minnesotans continues to increase and is currently approaching the overall statewide rate. Since 1990 it has increased by nearly two-thirds (62.5%). Since at least 2000, Asian Minnesotans have had the highest rate of homeownership of any racial or ethnic minority in the state. However, there are differences in homeownership across various detailed Asian groups.

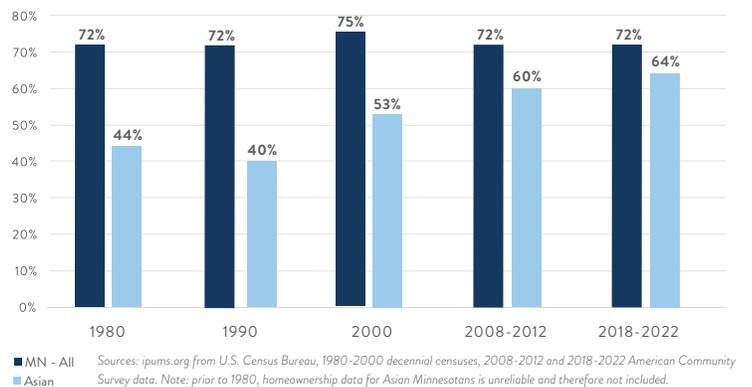

Since 1980, rates of homeownership have risen broadly and consistently for a wide range of Asian Minnesotans, particularly among Lao, Vietnamese, and Korean households. Homeownership for Hmong Minnesotans increased sharply during the 1990s. The latest survey data, collected between 2018 and 2022, shows that it likely currently exceeds 60%. The “other” Asian category includes various immigrant communities that are too small to disaggregate in this sample.

(For complete homeownership data for all available detailed groups – please see the appendix of this document.)

# Homeownership for Asian Households

In addition to increasing Asian homeownership overall, there have been significant gains across every age cohort. The largest gains have come for those in middle age, from the 45-to-49 cohort through the 55-to-59 cohort, as well as the 75-to-79 cohort. These gains may be explained in part by increasing social capital for migrants in the decades since their arrival, similar benefits accrued by second and third generations, as well as the changing socio-economic characteristics of newer Asian immigrants such as higher educational levels and more financial resources.

**Chart 11. Age-Specific Homeownership for Asian Minnesotans**

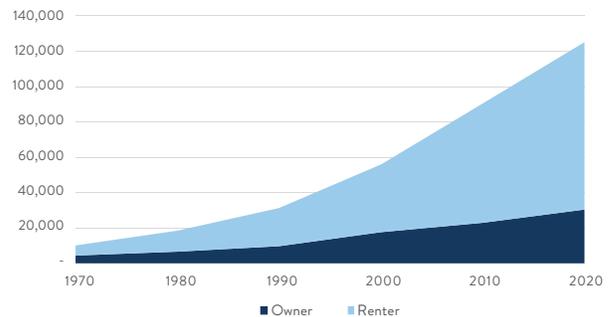

# Homeownership for Black or African American Households

In Minnesota, the number of Black or African American householders has grown from about 10,000 in 1970 to 125,000 in 2020. During that time, homeowners have increased from 4,338 to 30,544 (+600%), while renters have increased from 6,027 to 94,488 (+1,500%). In other words, since the 1970s, Black or African American householders have been increasingly concentrated into rental housing units. This is a historical trend unique to Black or African American households.

Since 1970, the overall homeownership rate for all Black or African American households (including U.S.-born African Americans as well as newer immigrant communities) has fallen by about one-third. Currently, Black or African American homeownership is less than half the statewide rate. Alarming, with the exception of the 1990s, Black or African American homeownership has fallen across every decade since at least the 1960s. (Historic data not included in this report indicates Black or African American homeownership of 46% in 1960.)

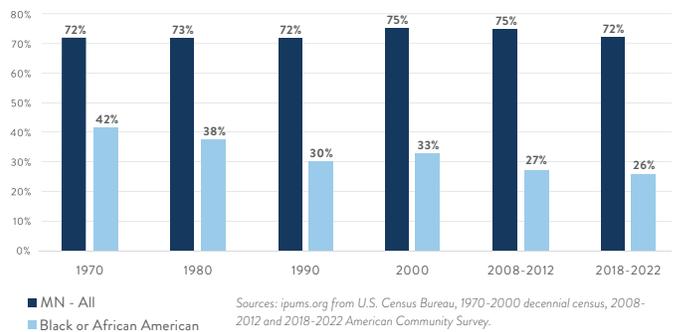

One of the striking trends in Black or African American homeownership is relatively higher rates for several immigrant communities than for U.S.-born African Americans. While the homeownership rate among Somali households has grown over time, from near 0% in 1980 to about 12% in the most recent data, it remains significantly lower than any other Black or African American group. Below, the “other Black” category includes newer immigrant communities that are too small to disaggregate in this sample. More homeownership detail for these groups can be found in the appendix of this report.

**Chart 12. Black or African American Householders by Housing Tenure**

**Chart 14. Detailed Homeownership Rates for Black or African American Minnesotans**

- 1980
- 1990
- 2000
- 2008-2012
- 2018-2022

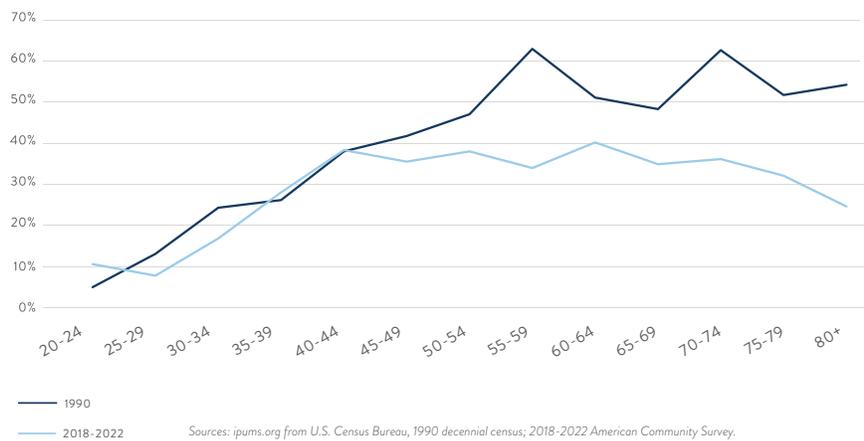

Sources: ipums.org from U.S. Census Bureau 1980-2000 decennial censuses, 2008-2012, and 2018-2022 American Community Survey data. Error bars show a 95% confidence level. Missing columns indicate data is unavailable.

# Homeownership for Black or African American Households

The historic age-specific trends for Black or African American Minnesotans indicate a general similarity for the 20-to-24 through the 40-to-44 cohorts, which follow the larger statewide trends of increasing homeownership through the life course. However, homeownership rates for the 45-to-49 and each successive cohort are significantly lower than they were in 1990. Put differently, in 2020, a Black or African American Minnesotan was no more likely to own their home in their mid-60s than in their mid-40s.

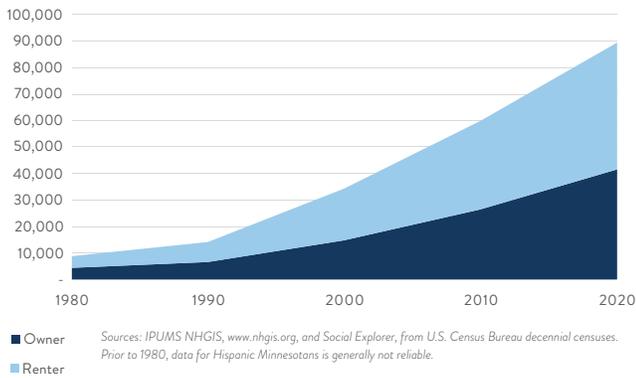

**Chart 15. Age-Specific Homeownership for Black or African American Minnesotans**

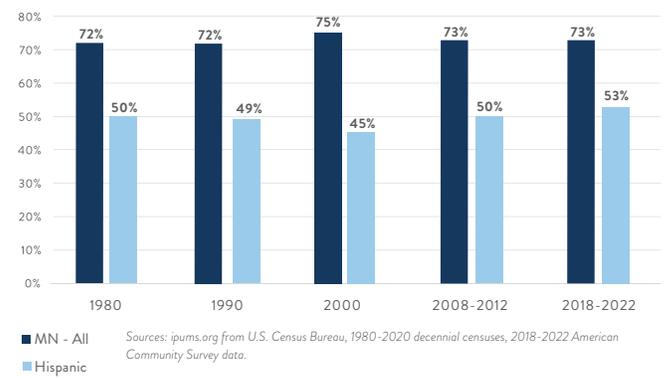

# Homeownership for Hispanic Households

From 1980 (the first year in which reliable data is available for Hispanic Minnesotans) to 2020, the number of Hispanic households has grown tenfold, from about 8,700 to 90,000. During that time, the number of Hispanic homeowners increased at a slightly smaller rate, from 4,282 to 41,526, while the number of Hispanic renters grew from 4,413 to 47,953. Since the year 2000, Hispanic homeownership has increased from 45% to 53%.

**Chart 16. Hispanic Householders by Housing Tenure**

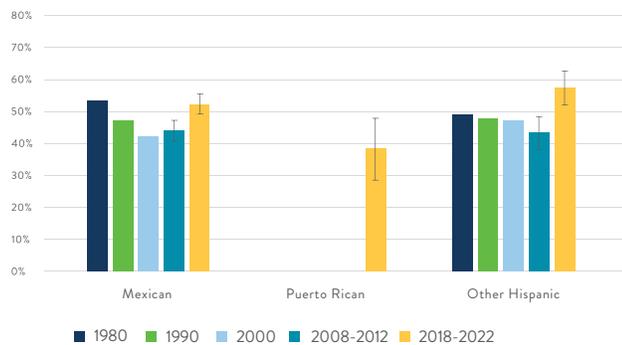

**Chart 17. Homeownership for Hispanic Minnesotans**

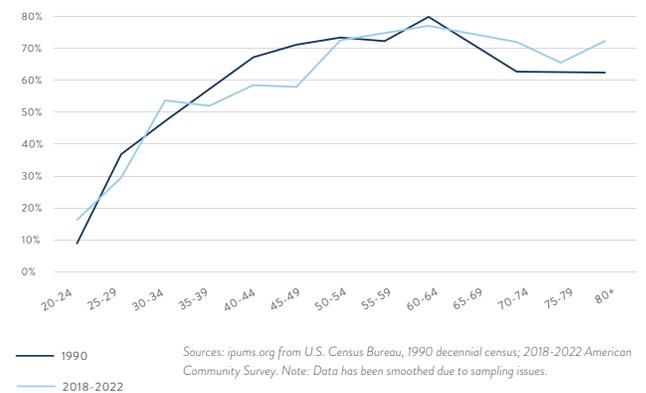

Hispanic homeownership has made modest, sustained gains since 2000, with broad increases in particular for Mexican and “other” Hispanics (nearly two-thirds of all Hispanic Minnesotans are of Mexican descent). Below, the “other Hispanic” category includes newer immigrant communities that are too small to disaggregate in this sample. More homeownership detail for these groups can be found in the appendix of this report.

There have been little significant changes to age-specific homeownership patterns among Hispanic Minnesotans. While the overall rate for Hispanic homeownership has increased slightly from 1990 to 2022, from about 49% to 53%, there were slight decreases for the 35-to-39 through 45-to-49 cohorts, with increases among rates for older Hispanics.

**Chart 18. Detailed Homeownership Rates for Hispanic Minnesotans**

**Chart 19. Age-Specific Homeownership for Hispanic Minnesotans**

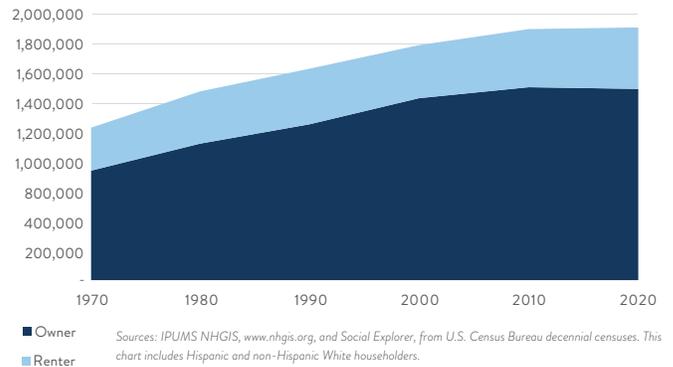

# Homeownership for White Households

From 1970 to 2020, the number of households headed by White Minnesotans increased by about two-thirds, from 1,136,020 to 1,886,540. However, from 2010 to 2020 the number of White homeowners declined slightly, from 1,437,173 to 1,427,087.

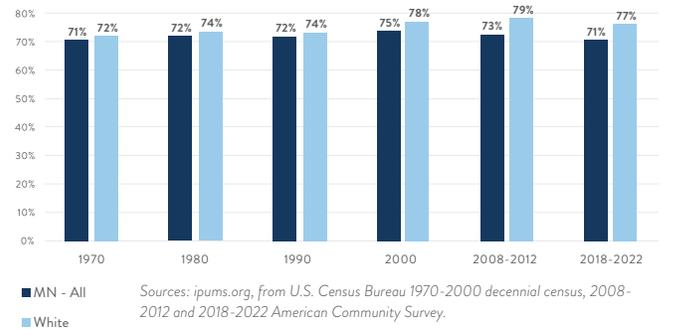

As expected, the homeownership rates for White Minnesotans closely follow – but are slightly higher than the overall state rate. Furthermore, the gap between White homeownership and statewide homeownership is gradually widening. This widening gap can be attributed to the growing diversity of the state population (i.e., a declining share of the state population composed of White non-Hispanic people), as well as the declining rate of homeownership among Black or African American Minnesotans, which pulls down the overall state rate.

The age-specific rates for White Minnesotans are generally unchanged from 1990 to 2022, with rates approaching 90% for the 45-to-49 through 65-to-69 cohorts. There have been moderate gains among the oldest White Minnesotans.

## CONCLUSION

**The demographic housing trends presented in this report reveal significant racial disparities that underscore the need for focused and sustained efforts to achieve a more equitable housing landscape.**

Of particular cause for concern is the falling rate of homeownership for U.S.-born African American Minnesotans. Although homeownership disparities may be rooted in historical inequities and systemic barriers, the homeownership rate for Black or African American Minnesotans is considerably lower today than in decades past. Addressing this and related challenges will require multi-faceted approaches, including collaboration across public, private, and nonprofit sectors. By prioritizing equitable housing policies, increasing access to affordable housing, and continuing to dismantle systemic inequities, Minnesota can move closer to ensuring that all residents have the opportunity not just to live in – but to own safe and affordable homes, regardless of their race. This report serves as a reminder to stakeholders at all levels of the need to address these disparities and to create a more inclusive housing landscape for all Minnesotans.

## APPENDIX

### **The appendix of this report contains homeownership (tenure) and household type for detailed groups in Minnesota.**

This portion of the report is based upon a recent dataset published by the U.S. Census Bureau, the Detailed Demographic and Housing Characteristics File B (also known as the DHC-B file). Although the data refers to 2020 and was part of Census 2020, the data was published only recently, in August 2024. The data for these detailed groups refers to those groups alone or in combination with other groups. The DHC-B data is somewhat complex. Readers are encouraged to consult the technical documentation of this data, which may be found here: <https://www.census.gov/programs-surveys/decennial-census/technical-documentation/complete-technical-documents.html#dhc-b>.
