A DEMOGRAPHIC ANALYSIS FOR THE CITY OF COOK, MN

OVERVIEW

The Iron Range Resources and Rehabilitation Board (IRRRB) mission is to promote and invest in businesses, community, and workforce development for the betterment of northeastern Minnesota. As such, the IRRRB utilizes a variety of techniques to acquire data that is utilized for informing their planning and decision-making, or for providing informational resources to various stakeholders. As part of their data acquisition process, the IRRRB at times makes use of external vendors such as North Point Geographic Solutions (NPGS) in Duluth, Minnesota to assist with their data gathering and analysis.

The following report represents a data gathering and analysis project the IRRRB tasked NPGS to implement for determining requested demographic data within specified buffered regions surrounding the city of Cook, Minnesota. The specific data analyzed included population, age, commuting, income, education, and industry. The purpose of the project was to provide the IRRRB with a set of reference information that could be utilized by staff and stakeholders for general inferences regarding demographic data in the specified geographic regions.

APPROACH

The IRRRB requested NPGS focus their data gathering and analysis on the following three tasks:

1. Identify the total population, age, household income, educational attainment, and industry of employment of residents within a 25-mile, a 45-mile, and a 65-mile buffer from the city of Cook.
2. Within a 45-mile buffer, identify information regarding resident's commuting patterns. Specifically focused on:
 - a. How many people commute less than or equal to 25 miles to work.
 - b. How many people commute at least 45 miles to work.
3. Within a 45-mile buffer, of those residents who commute more than 25-miles to work, identify their income breakdown.

NPGS utilized the American Community Survey (ACS) data from the U.S. Census Bureau, along with the following tools:

- ArcMap Version 10.3.1 - Geographic Information Systems (GIS) analysis software
- Microsoft Excel – For calculating data and generating graphs
- Microsoft Word – For reporting analysis results

ArcMap was used to create buffer zones of 25-miles, 45-miles, and 65-miles around the city of Cook. In order to summarize the census data using the 25-mile, 45-mile, and 65-mile buffers, a weighting factor would need to be determined for each census block based on its relationship to

A DEMOGRAPHIC ANALYSIS FOR THE CITY OF COOK, MN

each of the buffers. ArcMap was again utilized to derive a Boolean developed cover type raster from the NLCD 2011 Land Cover raster by reclassifying the value of all developed cover types to “1” (True) and non-developed cover types were set to “0” (False). The census block groups were then used to define the zones in a zonal statistics operation, with the output being a table that lists the total number of developed cover type cells that fall within each census block group. The census block groups were then clipped according to the 25, 45, and 65-mile buffers. From there, the clipped census block groups were used as zones for additional zonal statics operations. The resulting tables identified the number of developed land cover type cells that fell within each of the clipped census block groups. Each census block group was then factored into the analysis based upon the percentage of the number of developed cover type cells that remain after being clipped by the buffer layer. For example, a census block group with a total population of 1,000 and 100 developed cover type cells but only 25 of the block group’s developed, the cover type cells located within the analysis buffer, would contribute 25% (or 250 people) of its population to the total population within the buffer region. The data was then exported to Microsoft Excel where a pivot table used to create a summary and to generate the necessary charts and graphs. This same methodology was used for calculating the total population, resident commute time, household median income, industry, and education summaries.

DATA RESOURCES

The following data sources were used as reference for this project:

Multi-Resolution Land Characteristics Consortium, National Land Cover Database 2011

- NLCD 2011 Land Cover

U.S. Census Bureau, 2010-2014 American Community Survey 5-Year Estimates

- Population 25 years and over
- C24030
 - Sex by Industry for the Civilian Employed Population 16 Years and Over
 - Universe: Civilian employed population 16 years and over

ASSUMPTIONS

The public census data NPGS utilized is based on geographic boundaries broken down by census block groups of varying size. From a data analysis perspective, the U.S. census data is assumed to be generalized information with a high degree of variability and potential inaccuracy, however it can be useful for interpreting general trends or patterns. Since the data is associated with specific census block groups, there are additional assumptions that were made for this project, in order to extrapolate information associated with the requested buffer zones surrounding the city of Cook. Specifically, NPGS assumed that census survey respondents were distributed only in the developed areas as defined by the NLCD 2011 Land Cover dataset within their respective census block groups. Figure 1 displays the 25-mile, 45-mile, and 65-mile analysis buffers, as well as the census block groups.

CITY OF COOK ANALYSIS

The data collection and analysis for the City of Cook, MN focused on the census block groups located within a 25-mile, 45-mile, and 65-mile buffer surrounding the city (Fig. 1). Unless the block group was entirely contained within the buffer zone, the factoring described in the project approach section was applied to the block group data.

The following graph displays the estimated age by sex breakdown for residents living within 65-miles of the city of Cook, MN.

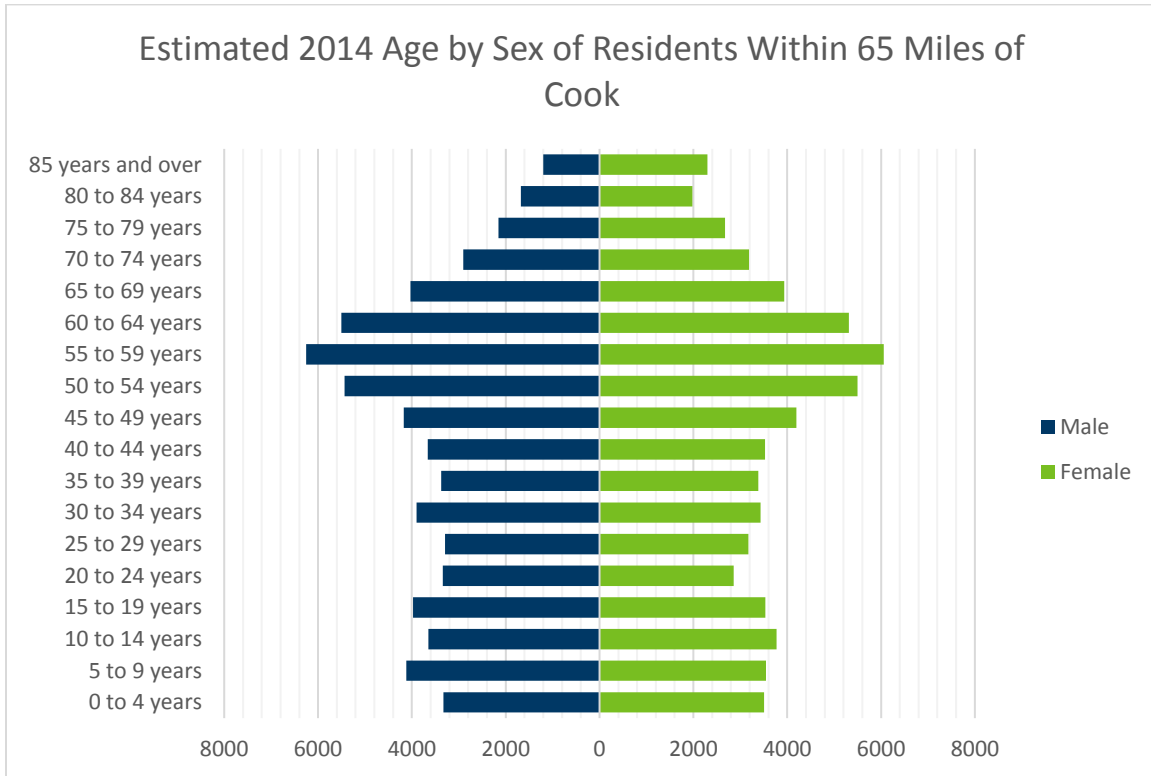

Figure 4: Estimated 2014 Age by Sex of Residents Within 65 Miles of Cook

A DEMOGRAPHIC ANALYSIS FOR THE CITY OF COOK, MN

COOK INCOME DATA

The following graph displays the estimated household income breakdown for residents living within 25-miles of the city of Cook, MN. Based on the data sources utilized, and accounting for population distribution assumptions, the majority of households (53%) have an income of at least \$40K.

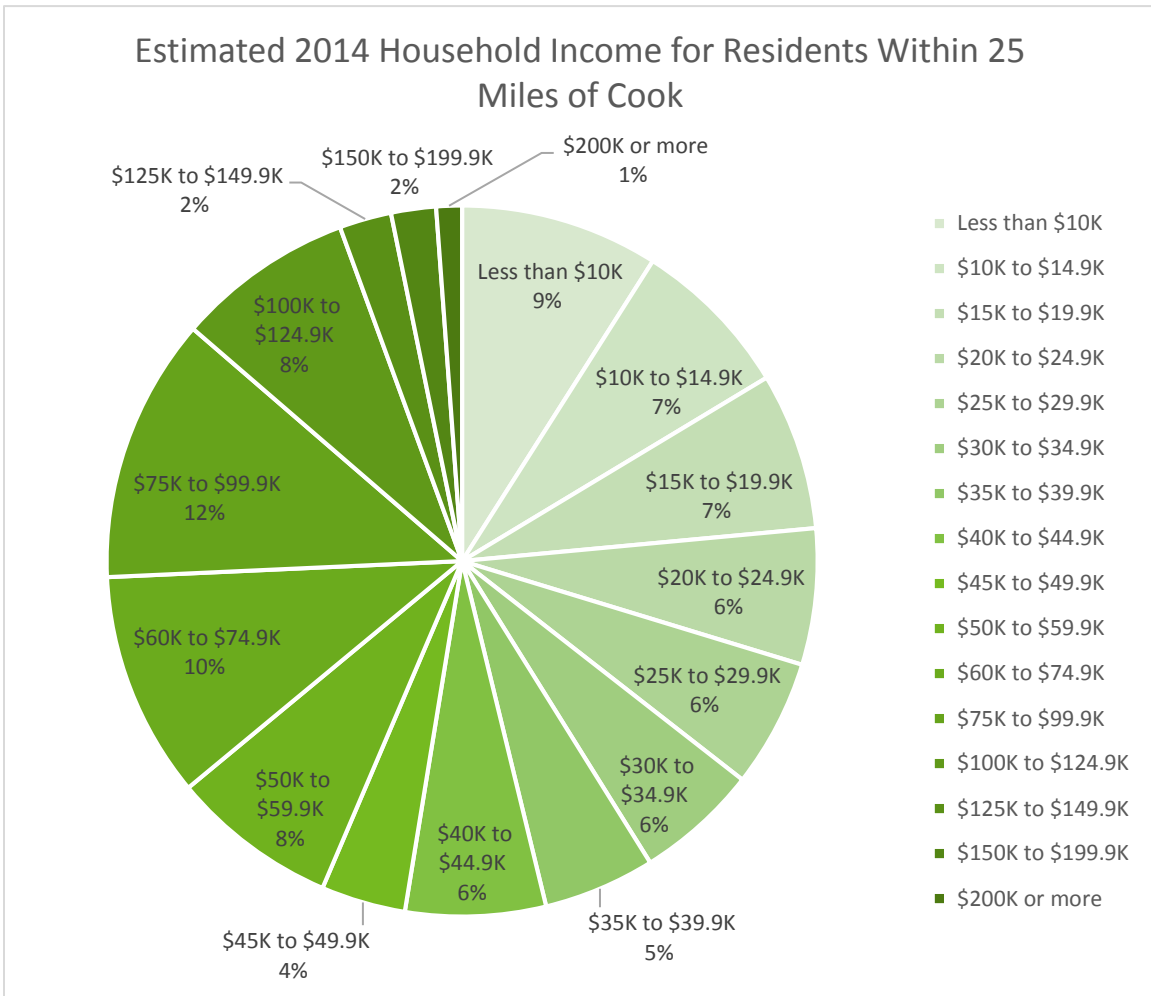

Figure 5: Estimated 2014 Household Income for Residents within 25 Miles of Cook

A DEMOGRAPHIC ANALYSIS FOR THE CITY OF COOK, MN

The following graph displays the estimated household income breakdown for residents living within 45-miles of the city of Cook, MN. Based on the data sources utilized, and accounting for population distribution assumptions, the majority of households (49%) have an income of at least \$45K.

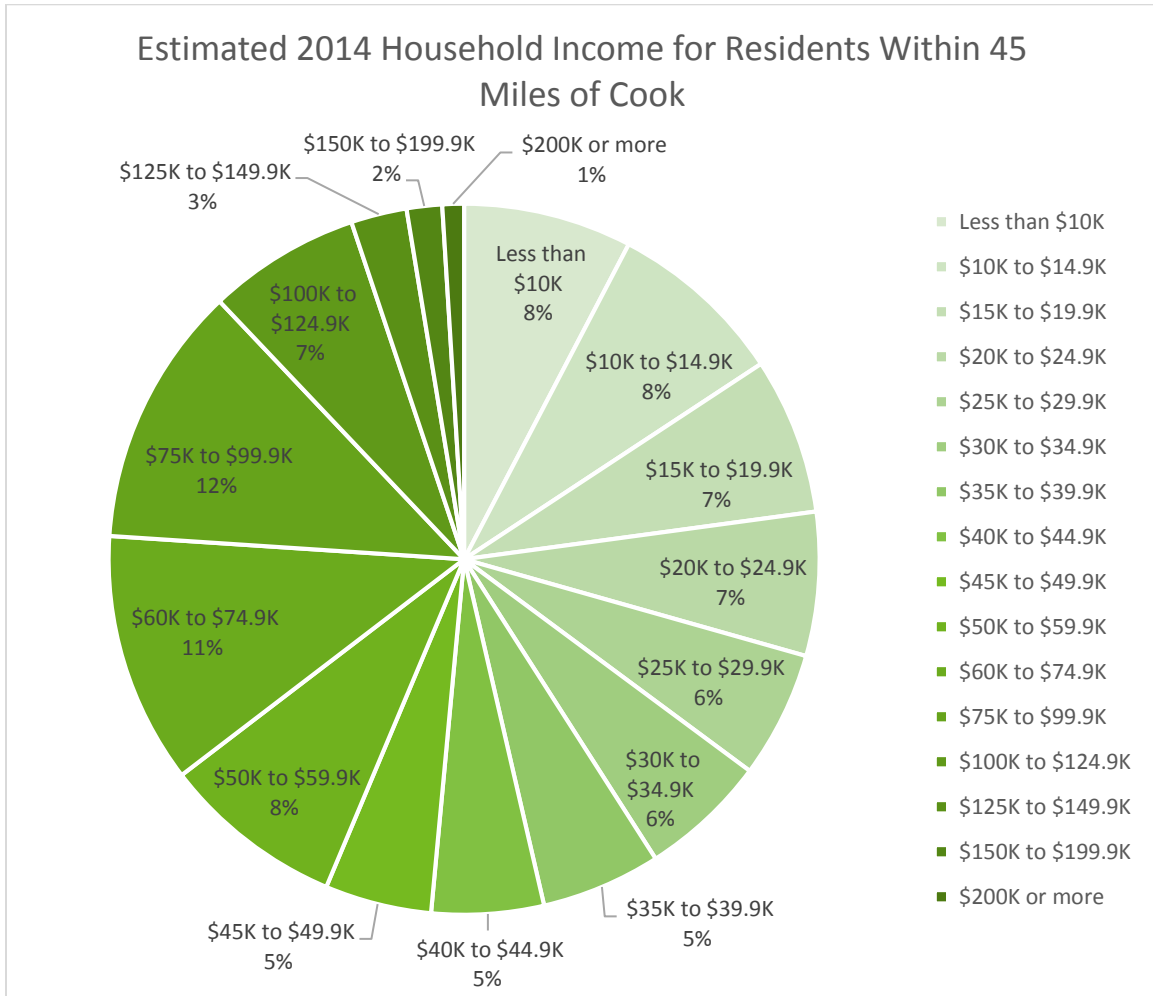

Figure 6: Estimated 2014 Household Income for Residents within 45 Miles of Cook

A DEMOGRAPHIC ANALYSIS FOR THE CITY OF COOK, MN

The following graph displays the estimated household income breakdown for residents living within 65-miles of the city of Cook, MN. Based on the data sources utilized, and accounting for population distribution assumptions, the majority of households (50%) have an income of at least \$45K.

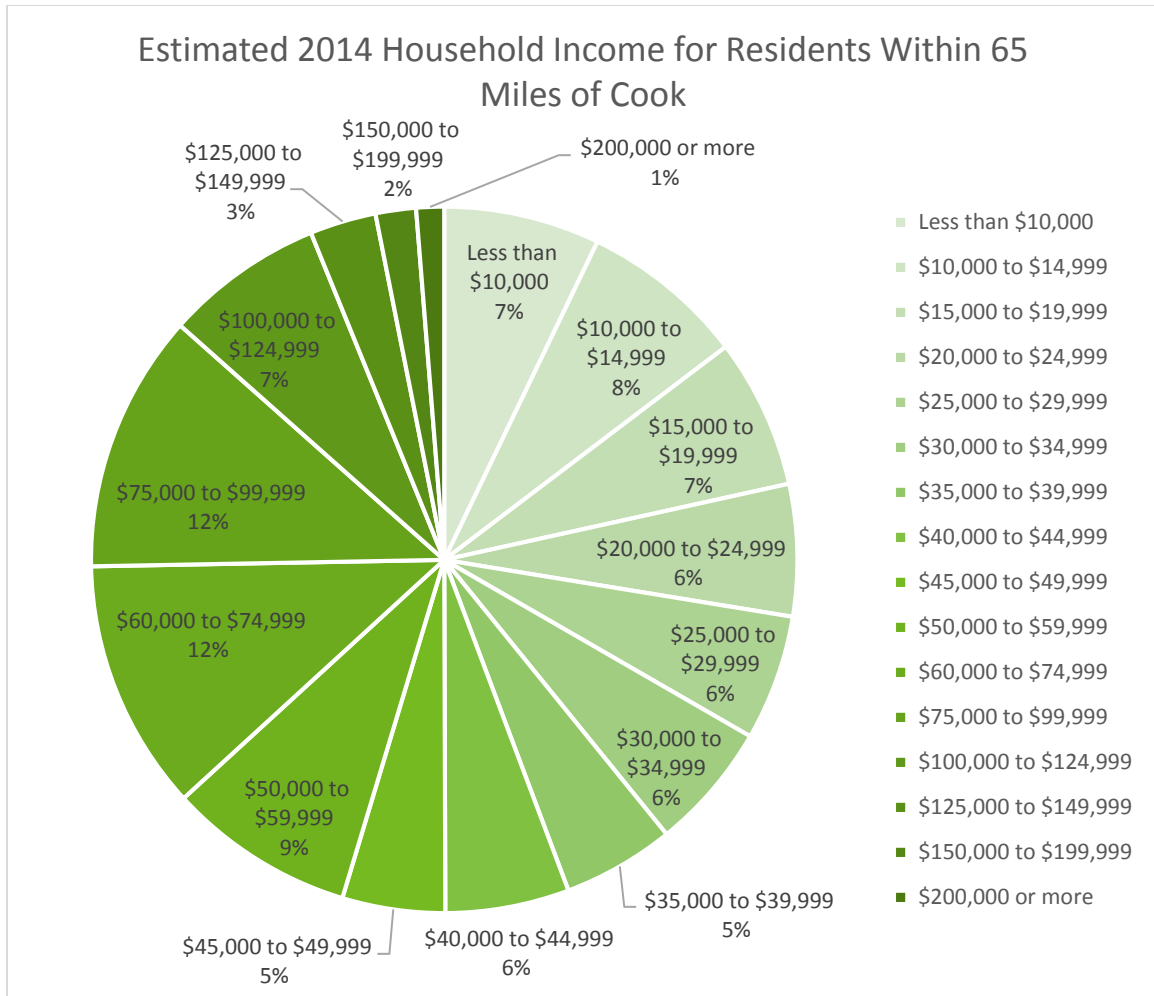

Figure 7: Estimated 2014 Household Income for Residents within 65 Miles of Cook

A DEMOGRAPHIC ANALYSIS FOR THE CITY OF COOK, MN

COOK COMMUTING DATA

The following table displays the estimated number of people living within 25-miles, 45-miles, and 65-miles of the city of Cook, MN with reported commuting times of greater than or equal to 30 minutes (assumed a 25-mile commute) and greater than or equal to 60 minutes (assumed a 45-mile commute). Based on the reported data, 25% of the residents within 25-miles commute greater than or equal to 30 minutes, and 6% of the residents within 25-miles commute greater than or equal to 60 minutes. Additionally, 25% of the residents within 45-miles commute greater than or equal to 30 minutes, and 6% of residents within 45-miles commute greater than or equal to 60 minutes. Lastly, 24% of the residents within 65-miles commute greater than or equal to 30 minutes, and 5% of residents within 65-miles commute greater than or equal to 60 minutes.

Area(miles ²)	(>=30mins)		(>= 60mins)	
25 Mile Buffer Population	5,198	25%	1,248	6%
45 Mile Buffer Population	19,925	25%	4,782	6%
65 Mile Buffer Population	13,529	24%	3,174	5%

Table 2: City of Cook, MN Commuting Data

A DEMOGRAPHIC ANALYSIS FOR THE CITY OF COOK, MN

The following graph displays the reported commuting time for residents living within 25-miles of the city of Cook, MN. Based on the data sources utilized, and accounting for population distribution assumptions, the majority of commuters (58%) fall within a range of < 5 minutes to 15–19 minutes and only 6% of residents living within 25-miles commute 60 minutes (approximately 45 miles) or more. It should be noted the data does not account for the location of commuter destinations.

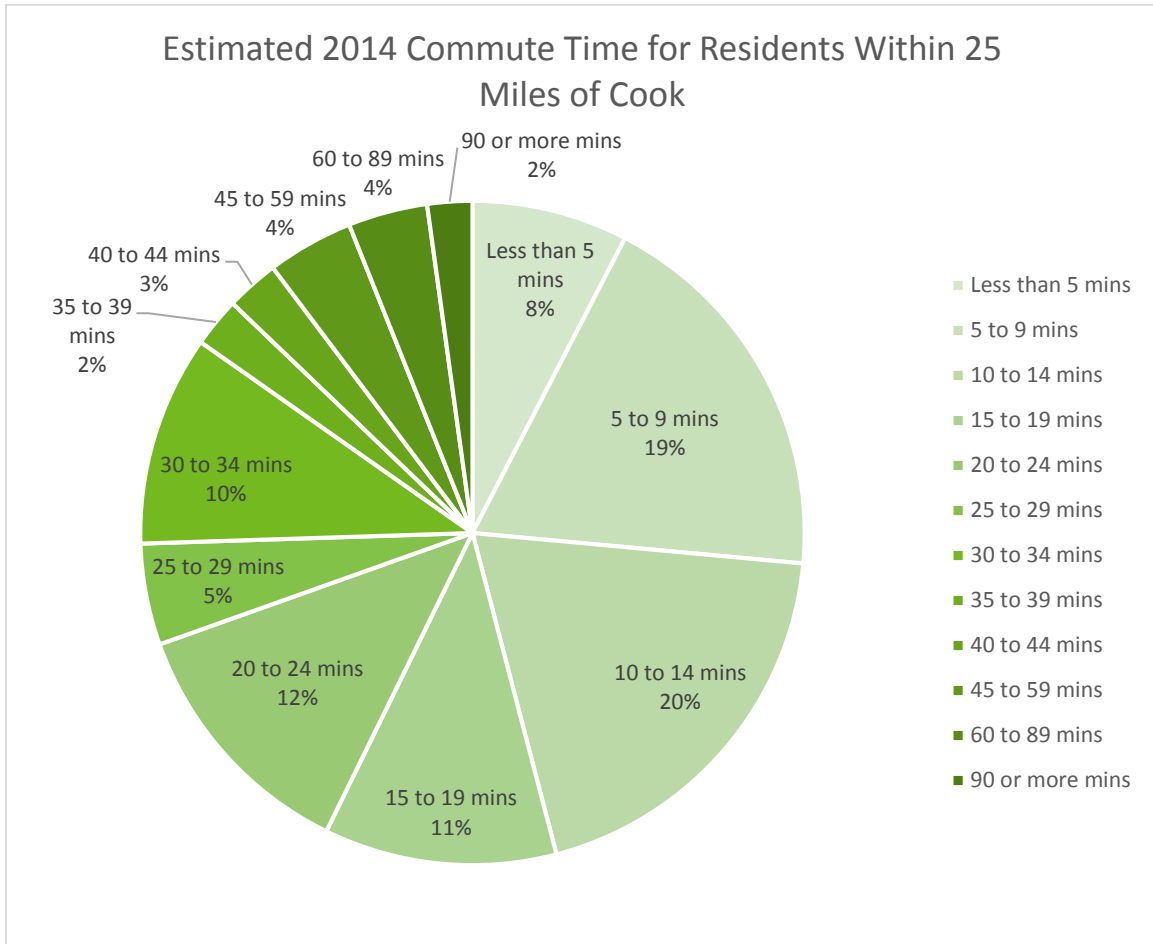

Figure 8: Estimated 2014 Commute Time for Residents within 25 Miles of Cook

A DEMOGRAPHIC ANALYSIS FOR THE CITY OF COOK, MN

The following graph displays the reported commuting time for residents living within 45-miles of the city of Cook, MN. Based on the data sources utilized, and accounting for population distribution assumptions, the majority of commuters (50%) fall within a range of 5-9 minutes to 15–19 minutes and only 6% of residents living within 45-miles commute 60 minutes (approximately 45 miles) or more. It should be noted the data does not account for the location of commuter destinations and is inclusive of the commuting times reported for residents within the 25-mile buffer of Cook.

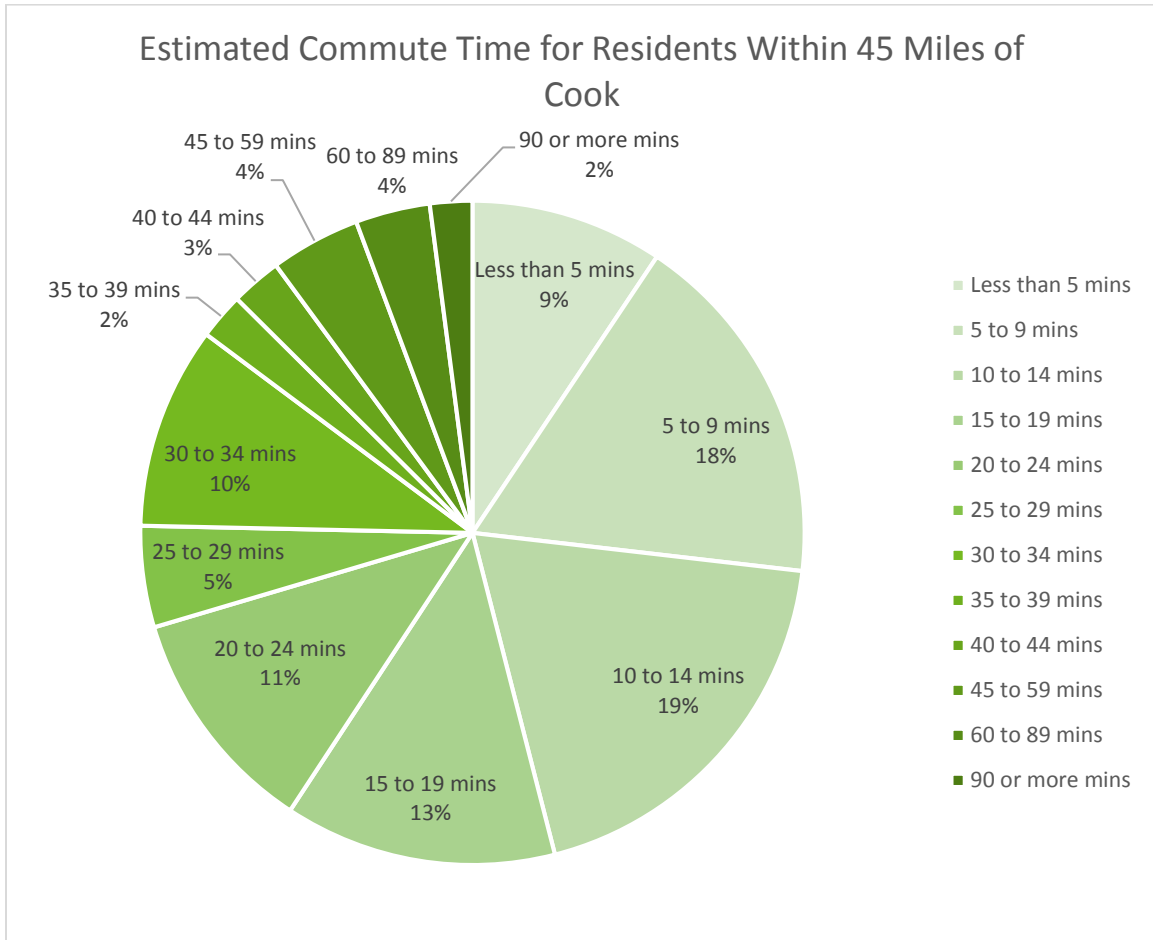

Figure 9: Estimated 2014 Commute Time for Residents within 45 Miles of Cook

A DEMOGRAPHIC ANALYSIS FOR THE CITY OF COOK, MN

The following graph displays the reported commuting time for residents living within 65-miles of the city of Cook, MN. Based on the data sources utilized, and accounting for population distribution assumptions, the majority of commuters (51%) fall within a range of 5-9 minutes to 15–19 minutes and only 5% of residents living within 65-miles commute 60 minutes (approximately 65 miles) or more. It should be noted the data does not account for the location of commuter destinations and is inclusive of the commuting times reported for residents within the 25-mile buffer and the 45-mile buffer of Cook.

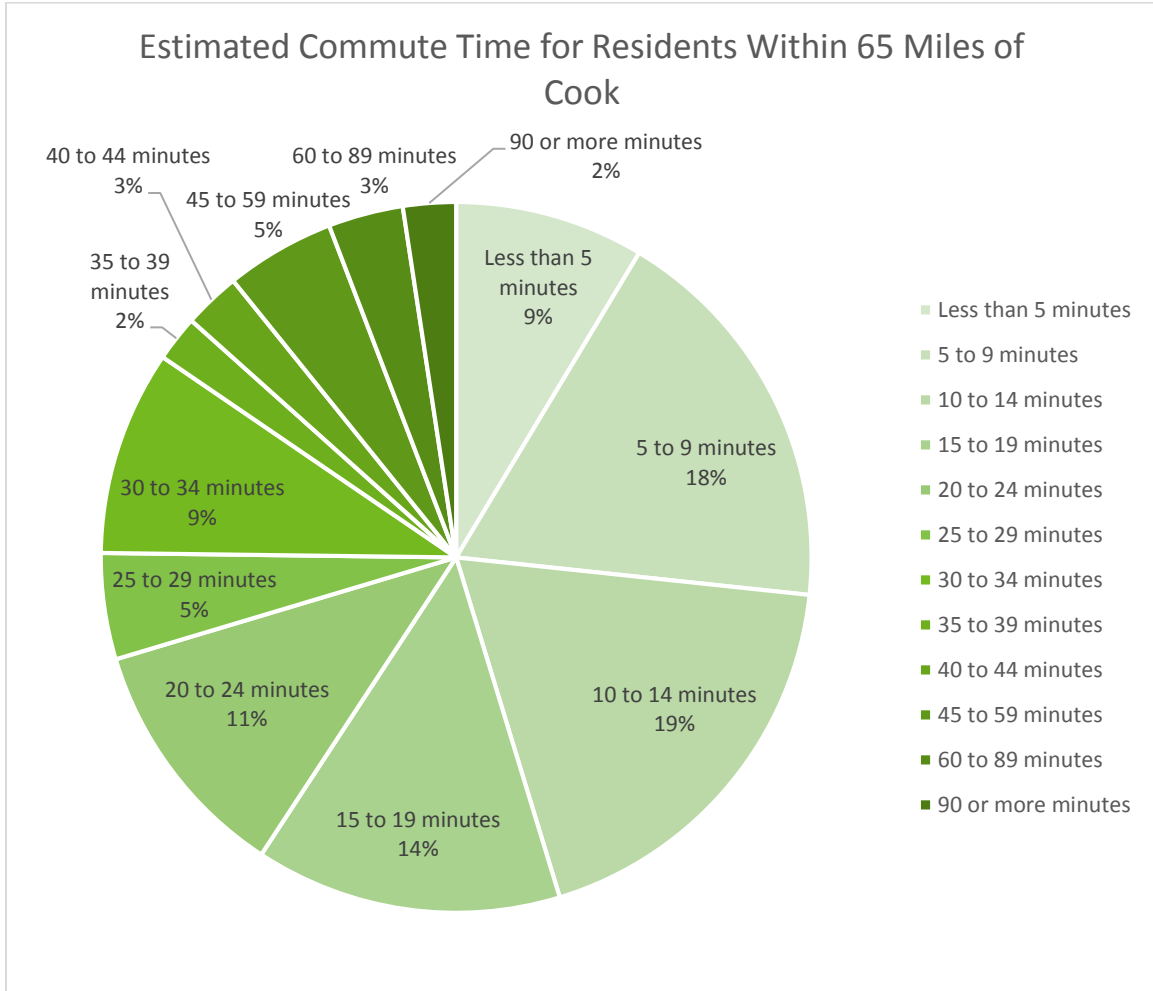

Figure 10: Estimated 2014 Commute Time for Residents within 65 Miles of Cook

COOK EDUCATION DATA

The following graph displays the estimated educational attainment for residents living within 25-miles of the city of Cook, MN. Based on the data sources utilized, and accounting for population distribution assumptions, 36% of respondents have earned a degree higher than a high school diploma.

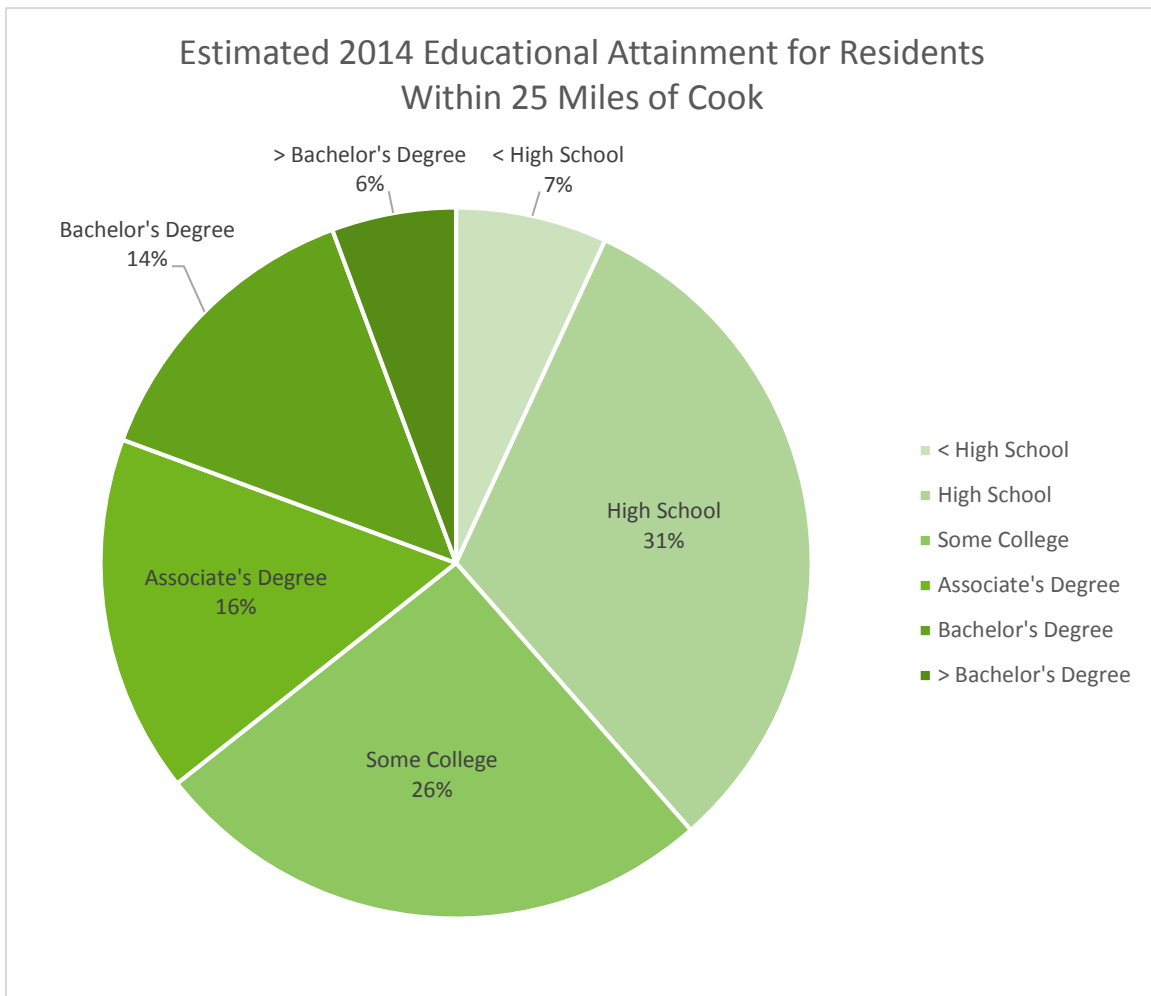

Figure 11: Estimated 2014 Educational Attainment for Residents within 25 Miles of Cook

A DEMOGRAPHIC ANALYSIS FOR THE CITY OF COOK, MN

The following graph displays the estimated educational attainment for residents living within 45-miles of the city of Cook, MN. Based on the data sources utilized, and accounting for population distribution assumptions, 34% of respondents have earned a degree higher than a high school diploma.

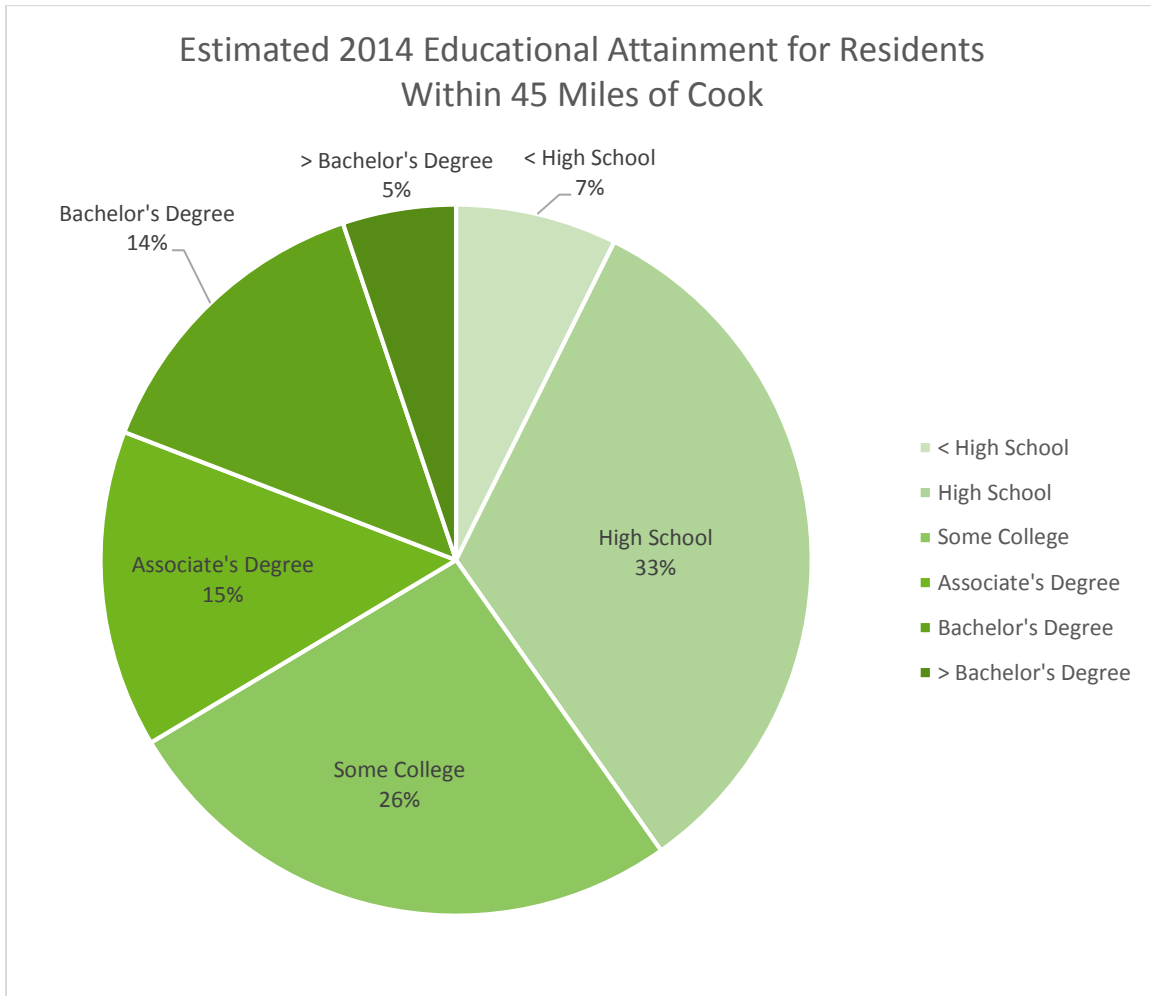

Figure 12: Estimated 2014 Educational Attainment for Residents within 45 Miles of Cook

A DEMOGRAPHIC ANALYSIS FOR THE CITY OF COOK, MN

The following graph displays the estimated educational attainment for residents living within 65-miles of the city of Cook, MN. Based on the data sources utilized, and accounting for population distribution assumptions, 33% of respondents have earned a degree higher than a high school diploma.

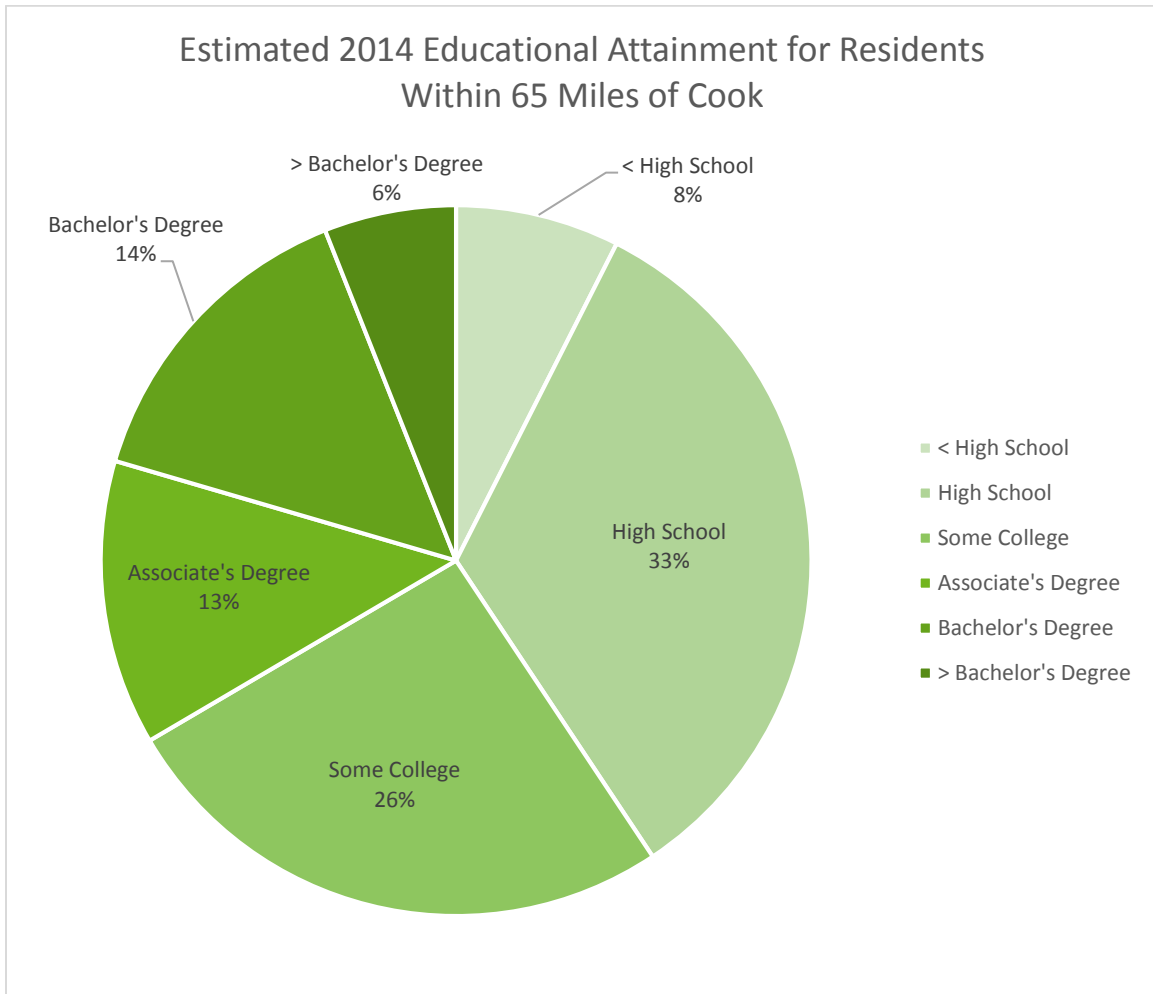

Figure 13: Estimated 2014 Educational Attainment for Residents within 65 Miles of Cook

A DEMOGRAPHIC ANALYSIS FOR THE CITY OF COOK, MN

COOK INDUSTRY DATA

The following table displays the estimated industry breakdown of employed residents living within 25-miles of the city of Cook, MN. Based on the data sources utilized, and accounting for population distribution assumptions, the industry category employing the most respondents (roughly 16%) is health care and social assistance.

Industry	25-Mile Buffer	
Health care and social assistance	1,491	15.65%
Arts, entertainment, and recreation	1,090	11.44%
Wholesale and retail trade	1,081	11.35%
Accommodation and food services	874	9.18%
Construction	802	8.42%
Manufacturing	707	7.42%
Educational services	626	6.57%
Finance and insurance, and real estate and rental and leasing	598	6.28%
Information, professional, scientific, and management, and administrative and waste management services	512	5.38%
Mining, quarrying, and oil and gas extraction	465	4.88%
Transportation and warehousing, and utilities	426	4.47%
Public administration	379	3.98%
Other services, except public administration	358	3.76%
Agriculture, forestry, fishing, and hunting	116	1.22%

Table 3: Estimated 2014 Industry of Employment for Residents within 25 miles of Cook

A DEMOGRAPHIC ANALYSIS FOR THE CITY OF COOK, MN

The following table displays the estimated industry breakdown of employed residents living within 45-miles of the city of Cook, MN. Based on the data sources utilized, and accounting for population distribution assumptions, the industry category employing the most respondents (roughly 18%) is health care and social assistance.

Industry	45-Mile Buffer	
Health care and social assistance	6,139	18.14%
Wholesale and retail trade	4,397	12.99%
Manufacturing	3,014	8.91%
Accommodation and food services	2,786	8.23%
Construction	2,620	7.74%
Mining, quarrying, and oil and gas extraction	2,434	7.19%
Information, professional, scientific, and management, and administrative and waste management services	2,293	6.78%
Educational services	2,214	6.54%
Finance and insurance, and real estate and rental and leasing	1,863	5.50%
Transportation and warehousing, and utilities	1,722	5.09%
Other services, except public administration	1,596	4.72%
Public administration	1,582	4.67%
Arts, entertainment, and recreation	666	1.97%
Agriculture, forestry, fishing, and hunting	518	1.53%

Table 4: Estimated 2014 Industry of Employment for Residents within 45 miles of Cook

A DEMOGRAPHIC ANALYSIS FOR THE CITY OF COOK, MN

The following table displays the estimated industry breakdown of employed residents living within 65-miles of the city of Cook, MN. Based on the data sources utilized, and accounting for population distribution assumptions, the industry category employing the most respondents (roughly 17 ½ %) is health care and social assistance.

Industry	65-Mile Buffer	
Health care and social assistance	10,147	17.52%
Wholesale and retail trade	7,858	13.57%
Manufacturing	5,751	9.93%
Accommodation and food services	4,985	8.61%
Construction	4,366	7.54%
Educational services	4,354	7.52%
Information, professional, scientific, and management, and administrative and waste management services	3,963	6.84%
Transportation and warehousing, and utilities	3,239	5.59%
Finance and insurance, and real estate and rental and leasing:	3,061	5.29%
Mining, quarrying, and oil and gas extraction	2,747	4.74%
Public administration	2,725	4.71%
Other services, except public administration	2,541	4.39%
Arts, entertainment, and recreation	1,125	1.94%
Agriculture, forestry, fishing, and hunting	1,055	1.82%

Table 5: Estimated 2014 Industry of Employment for Residents within 65 miles of Cook

CONCLUSIONS

The purpose of this project was to provide a demographic data analysis to the IRRRB within specified distances for the city of Cook, Minnesota. To accomplish this task, the IRRRB enlisted the resources of NPGS in Duluth, MN to gather, perform basic analysis, and report the data findings.

NPGS utilized the American Community Survey (ACS) 2010 – 2014, 5-year estimate data from the U.S. Census Bureau. NPGS chose census block groups vs. census blocks as the lowest common denominator. Ideally the census blocks would be the preferable geographical unit of measure since they are smaller scale and therefore more preferable for data distribution and accuracy (which would limit the effect one block could have on another block). However, the census data at the block level did not contain the information the IRRRB was interested in gathering; specifically, the travel time and median income data.

Regarding the 25-mile, 45-mile, and 65-mile buffer data, due to the assumed population distributions, and the overlap among the buffers surrounding the city, there is a fairly high degree of subjectivity associated with the outcome. It was determined that a direct correlation between income and commuting distance was not possible based on the limitations of the data. It should also be noted the census data did not contain specific commuting distances, rather commuting times were available, and from there assumptions were made regarding the approximate distance traveled in miles by respondents identified within each of the buffer regions. NPGS did attempt to provide a general picture of all the demographics of interest within the buffer regions with pie charts and tables, however this data can be made available.
