Glossary of Key Terms

Petrosino, Fronius, Goold, Losen, and Turner (2017)

Discipline rate per 100 students. The number of disciplinary actions per 100 students. It is calculated by dividing the number of disciplinary actions a student subgroup receives by the total enrollment of the subgroup and multiplying by 100. For example, if 100 Black students are suspended and there are 200 Black students total, the discipline rate per 100 students is $(100/200) \times 100 = 50$ (McIntosh, Barnes, Eliason & Morris, 2014).

Relative risk ratio (also known as risk ratio). The ratio between the rate at which one student subgroup receives a disciplinary action to the rate at which another student subgroup does. A relative risk ratio is calculated by dividing the rate at which one student subgroup receives a disciplinary action by the rate at which another student subgroup does. For example, if the risk rate for Black students is 40 percent and the risk rate for White students is 20 percent for a specific disciplinary action, the risk ratio for this action for Black students to White students would be $40/20$ or 2:1 (The Equity Project, 2015).

Risk rate. The percentage of students who experience a certain event. A risk rate is calculated by dividing the number of students experiencing a certain event by the total number of students enrolled. For example, if 50 White students are suspended out of 100 total White students enrolled, the risk rate is $50/100 = 50$ percent (McIntosh et al., 2014).

Risk index. A risk index is a table made up of the risk rates for student subgroups (such as by disability status, race/ethnicity, gender, or other protected status). The risk index allows for comparison of the risk rate for each student subgroup in the analysis (Losen, 2014).
