Summary Guide for Module 6: Hyperlinks

This module covers the specific tagging structure used for links.

Tagging structure

Links follow a specific tag structure which includes the following components:

- **Parent container**: Includes paragraph <P> tag, Table Data <TD> tag, or other tag types (i.e., lists, table of contents). This container houses the <Link> tag.
- **Link tag <Link>**: Contains the link's contents.
- **Text run**: Contains the link text.
- **Object Reference (Link-OBJR)**: Contains the digital instructions and defines the clickable area.

Hyperlink spans two lines

When a link wraps onto two lines or more, each line must be checked for proper link tagging structure. This training provides two methods to check and fix these links: Acrobat Reading Order tool and manually. **Note**: This link type has a Link - OBJR for each number of lines the link wraps to. If it is two lines, there are two Link - OBJRs.

As the largest employer in the state, we offer a wide range of job opportunities and tremendous potential for career advancement. Our jobs are located across the state and support over 100 agencies, boards, and commissions.
